Intersection Name: **Barwon Highway / Barwon Highway**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing / Proactive)	Likelihood	Consequence	Risk Score
1	No intersection from adjacent approach or other crashes recorded at intersection. Existing sight lines considered sufficient to meet minimum requirements. Turn lanes not warranted to accommodate existing peak hour traffic demands. Existing intersection from adjacent approach and rear end crashes are considered to be rare even though no crashes are reported.	Proactive	Rare - Less than once every ten years	Major	Medium
2					
3					
4					
5					
6					
7					
8					

Intersection Name: **Barwon Highway / Barwon Highway**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demand, as existing turn lanes are sufficient to accommodate the increase in project traffic. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood changed to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes, as well as rear end crashes along the higher turn radius left turn slip lane (CHL).	Moderate - Once or more per year (but less than once per week)	Major	Medium

8				

Intersection Name: **Barwon Highway / Barwon Highway**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Barwon Highway / Leichhardt Highway**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn warrant analyses indicate the requirement for implementing turn lanes to accommodate peak hour traffic volumes. Crash types such as rear end crashes and opposing turn crashes my be exacerbated as a result of the Project. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. However, sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands and existing AUL turn treatments are considered sufficient. The intersection lane configuration requires upgrade to accommodate a CHR(s) turn treatment. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Possible impact on roadside infrastructure due to swept path requirements (refer to swept path drawings in the TIA report). Larger turn paths of OSOM vehicles may increase likelihood of intersection from adjacent approach and other crash types. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Cunningham Highway / East Sawmill Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing / Proactive)	Likelihood	Consequence	Risk Score
1	Existing sight lines considered sufficient. A CHR and BAL lane configuration is required on Albert Street to accommodate existing peak hour traffic demands. The existing geometry allows for a BAL and BAR treatments with a two-way carriageway and divided median. Refer to TIA report.	Proactive	Rare - Less than once every ten years	Major	Medium
2	Recent 5-year crash data indicated that there was 1 crash of DCA Code 8 which included a crash between a vehicle leaving a parking bay and another vehicle travelling straight. The crash resulted in medical treatment.	Existing	Unlikely - Once every five or ten years	Moderate	Medium
3					
4					
5					
6					
7					
8					

Intersection Name: **Cunningham Highway / Elizabeth Street**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. A CHR would be required on Albert Street within the median strip to accommodate the Project peak hour traffic demands. All other existing turn treatments are considered sufficient. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient capacity, delay and LOS would be available, as such no impact on vehicle queueing and delay anticipated. Likelihood of crashes might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	The additional Project related traffic might increase the risk of crashes on vehicles leaving the respective parking bays. Likelihood is anticipated to increase to moderate with hospitalisation as consequence.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Cunningham Highway / Leichhardt Highway**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Increase in Project related traffic volumes may increase risk of vehicle turning crashes.	Moderate - Once or more per year (but less than once per week)	Major	Medium
3	Increase in Project related traffic volumes may increase risk of off carriageway on curve crashes.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Cunningham Highway / Leichhardt Highway**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium
2	Specific requirements for any upgrade or improved safety measures to be assessed during detail design and traffic management plan. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Rare - Less than once every ten years	Major	Medium
3	Specific requirements for any upgrade or improved safety measures to be assessed during detail design and traffic management plan. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Rare - Less than once every ten years	Major	Medium

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Cunningham Highway / Whetstone Access Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements. Possible impact on roadside infrastructure due to swept path requirements (refer to swept path drawings in the TIA report). Larger turn paths of OSOM vehicles may increase likelihood of intersection from adjacent approach and other crash types. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. 1	Opposing vehicle turning crashes during daylight and clear conditions. 4 crashes in last 4 years. Medical treatment and minor injury.	Existing	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
2	Rear-end crashes during daylight and clear conditions. Only 1 crash in last 5 years. Medical treatment required.	Existing	Unlikely - Once every five or ten years	Moderate	Medium
3	Queue spill back likely to occur within existing situation based on SIDRA modelling. Refer to TIA Report. This may lead to an existing risk of rear end crashes at the intersection.	Existing	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
4	The intersection allows for an unsignalized left turn stand up or slip lane. This allows for higher entry speeds with a risk of right or left turn rear end and intersection from adjacent approach crashes.	Proactive	Unlikely - Once every five or ten years	Major	Medium
5	Intersection has insufficient line marking which may impact driver behaviour and have a risk on vehicles from one direction crashes.	Proactive	Unlikely - Once every five or ten years	Moderate	Medium
6	Filter right turns are currently allowed for which may lead to a risk in opposing vehicle turning crashes. The SIDRA modelling indicates this intersection is well above capacity, which will the length of queues and the chance of queue spill back occurring.	Proactive	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
7					
8					

Intersection Name: **Gore Highway / Alderley Street**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Increase in Project related traffic volumes may increase risk of opposing vehicle turning crashes.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
2	Increase in Project related traffic volumes may increase risk of rear end crashes.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
3	Increase in Project related traffic volumes will increase the length of queues and the chance of queue spill back occurring. Refer to TIA report Section 5.4.5. This may lead to an increased risk of rear end crashes at the intersection.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
4	The existing unsignalized left turn stand up or slip lane (s) of the intersection may exacerbate the risk of right or left turn rear end and intersection from adjacent approach crashes as a result of the Project and increased volumes. The probability of vehicle to vehicle conflict would increase with increased traffic volume and subsequently also the likelihood.	Moderate - Once or more per year (but less than once per week)	Major	Medium
5	Insufficient line marking with increase in Project related traffic volumes may increase risk of vehicles from one direction crashes.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
6	Existing phasing with filter right turns may lead to a risk in opposing vehicle turning crashes as a result of the Project.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium

Intersection Name: **Gore Highway / Athol School Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Existing turn lanes (AUL, CHR) sufficient to accommodate Project traffic requirements (AUL or CHL, CHR). Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Possible impact on roadside infrastructure due to swept path requirements (refer to swept path drawings in the TIA report). Larger turn paths of OSOM vehicles may increase likelihood of intersection from adjacent approach and other crash types. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Gore Highway / Athol School Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Gore Highway / Bushy Lane**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Turn lanes would be required to accommodate peak hour turn movement volumes. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan (TMP) from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable.TMP should reflect updated construction duration estimates and final peak hour volumes. Road safety audits to be carried out at design stage and post-construction stage where such road upgrade works are required.	Unlikely - Once every five or ten years	Major	Medium
2	Heavy vehicle truck turning signage would be required in combination with possible temporary speed reduction signage through the intersection for the duration of construction. This may enhance decision and reaction times for vehicles to identify larger gaps in the traffic stream as speeds would be lower. This will be determined and finalised during construction stage as per contractor required risk assessments when preparing appropriate Traffic Management Plans (TMP's) and Traffic Guidance Schemes (TGS's, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements.	Unlikely - Once every five or ten years	Major	Medium

8					

Intersection Name: **Gore Highway / Campbell Street**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments are required based on Project peak hour traffic demands to implement a CHR(s). Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Existing lane configuration is sufficient to accommodate additional Project traffic.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Rear end crashes may be exacerbated as a result of the Project due to increase in mass and kinetic energy through the intersection. Likelihood is anticipated to increase to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Gore Highway / Campbell Street**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Turn lanes would be required to accommodate peak hour turn movement volumes. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan (TMP) from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable.TMP should reflect updated construction duration estimates and final peak hour volumes. Road safety audits to be carried out at design stage and post-construction stage where such road upgrade works are required.	Unlikely - Once every five or ten years	Major	Medium
2	Heavy vehicle truck turning signage would be required in combination with possible temporary speed reduction signage through the intersection for the duration of construction. The provision of a CHR(s) turn lane might also mitigate for rear end crashes. This will be determined and finalised during construction stage as per contractor required risk assessments when preparing appropriate Traffic Management Plans (TMP's) and Traffic Guidance Schemes (TGS's, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements.	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - With Inland Rail (Cumulative) Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	No action required, as risk score has not changed from the without development level. However, at design stage and post-construction stage road safety audits are to be carried out as per standard design process to understand if any road upgrade works are required such as formalising minor road approach to a paved standard for at least the first 10m as per Austroads Guide to Road Design Part 4, Figure 7.4 with minimum width of 6-8m. Final details regarding kerb turnouts, kerb to kerb widths, entry and exit tapers line marking etc. to be determined during detail design.

Intersection Name: **Gore Highway / Gilgai Lane**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing / Proactive)	Likelihood	Consequence	Risk Score
1	No intersection from adjacent approach or other turn movement crashes recorded at intersection. Existing sight lines considered sufficient. Turn lanes not required to accommodate existing background traffic demands. Refer to TIA report.	Proactive	Rare - Less than once every ten years	Major	Medium
2	One rear end crash was recorded. The rear end crash consisted of a multi-vehicle crash during clear daylight hours and resulted in a fatality.	Existing	Unlikely - Once every five or ten years	Extreme	Medium

Intersection Name: **Gore Highway / Gilgai Lane**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments required based on Project peak hour traffic demands. The existing BAL lane provision is considered sufficient, however a CHR(s) would be required. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Possible impact on roadside infrastructure due to swept path requirements (refer to swept path drawings in the TIA report). Larger turn paths of OSOM vehicles may increase likelihood of intersection from adjacent approach and other crash types. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Rear end crashes may be exacerbated as a result of the Project due to increase in mass and kinetic energy through the intersection. Likelihood is anticipated to increase to moderate.	Moderate - Once or more per year (but less than once per week)	Extreme	High

Intersection Name: **Gore Highway / Gilgai Lane**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium
2	Heavy vehicle truck turning signage would be required in combination with possible temporary speed reduction signage through the intersection for the duration of construction. The provision of a CHR(s) turn lane might also mitigate for rear end crashes. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage.	Unlikely - Once every five or ten years	Extreme	Medium

As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Gore Highway / Millmerran-Leyburn Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments required based on Project peak hour traffic demands. The existing BAL lane provision is considered sufficient, however a CHR(s) would be required. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Possible impact on roadside infrastructure due to swept path requirements (refer to swept path drawings in the TIA report). Larger turn paths of OSOM vehicles may increase likelihood of intersection from adjacent approach and other crash types. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Gore Highway / Saleyards Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments are required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. it is required to upgrade the existing BAR to a CHR(s) configuration. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation measures required for such single vehicle crashes.	Unlikely - Once every five or ten years	Moderate	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments are required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. it is required to upgrade the existing BAR to a CHR(s) configuration. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Existing minor approach road is gravel and unformed which may cause gravel spill over onto main road as well as dust build up which may impact visibility. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Millmerran-Inglewood Road / Forestry Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. Formalising minor road approach to a paved standard for at least the first 10m as per Austroads Guide to Road Design Part 4, Figure 7.4 with minimum width of 6-8m. Final details regarding kerb turnouts, kerb to kerb widths, entry and exit tapers line marking etc. to be determined during detail design. Road safety audits to be carried out at design stage and post-construction stage where such road upgrade works are required.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Millmerran-Inglewood Road / Moffatt Reserve Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Texas-Yelarbon Road / Access Track**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Existing minor approach road is an unformed gravel road which may cause gravel spill over onto main road as well as dust build up which may impact visibility. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Texas-Yelarbon Road / Access Track**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. Formalising minor road approach to a paved standard for at least the first 10m as per Austroads Guide to Road Design Part 4, Figure 7.4 with minimum width of 6-8m. Final details regarding kerb turnouts, kerb to kerb widths, entry and exit tapers line marking etc. to be determined during detail design. Road safety audits to be carried out at design stage and post-construction stage where such road upgrade works are required.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Toowoomba-Cecil Plains Road / Brimblecombe Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	No action required, as risk score has not changed from the without development level. However, at design stage and post-construction stage road safety audits are to be carried out as per standard design process to understand if any road upgrade works are required such as removing/relocating conflict points impacting vehicle turn paths. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path would be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing / Proactive)	Likelihood	Consequence	Risk Score
1	Queue spill back likely to occur based on SIDRA modelling. Refer to TIA Report. This may lead to an existing risk of rear end crashes at the intersection.	Proactive	Unlikely - Once every five or ten years	Moderate	Medium
2	The intersection allows for an unsignalized left turn stand up or slip lane. This allows for higher entry speeds with a risk of right or left turn rear end and intersection from adjacent approach crashes.	Proactive	Unlikely - Once every five or ten years	Moderate	Medium
3	Intersection has insufficient line marking which may impact driver behaviour and have a risk on vehicles from one direction crashes.	Proactive	Unlikely - Once every five or ten years	Moderate	Medium
4	Opposing through and through movements from side roads during daylight and clear conditions. Only 1 crash in last 5 years.	Existing	Unlikely - Once every five or ten years	Major	Medium
5	Opposing through and right movements from side roads during daylight and clear conditions. Only 1 crash in last 5 years.	Existing	Unlikely - Once every five or ten years	Major	Medium
6	Filter right turns are currently allowed for which may lead to a risk in opposing vehicle turning crashes.	Proactive	Unlikely - Once every five or ten years	Major	Medium
7					
8					

Intersection Name: **Toowoomba-Cecil Plains Road / McDougall Street**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Queue spill back likely to increase slightly based on SIDRA modelling. Refer to TIA Report Section 5.4.5. This may lead to an increased risk of rear end crashes at the intersection.	Unlikely - Once every five or ten years	Moderate	Medium
2	The existing unsignalized left turn stand up or slip lane (s) of the intersection may exacerbate the risk of right or left turn rear end and intersection from adjacent approach crashes as a result of the Project and increased volumes. The probability of vehicle to vehicle conflict would increase with increased traffic volume and subsequently also the likelihood.	Moderate - Once or more per year (but less than once per week)	Major	Medium
3	Insufficient line marking with increase in Project related traffic volumes may increase risk of vehicles from one direction crashes.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
4	No change anticipated as through movement vehicles at the intersection will not increase as a result of the project nor will Project vehicles travel straight across the intersection. No change to crash type or severity anticipated as a result of the Project for such single vehicle crashes.	Unlikely - Once every five or ten years	Major	Medium
5	No change anticipated as right turn movement from side roads will not increase as a result of the project nor will Project vehicles travel straight across the intersection. No change to crash type or severity anticipated as a result of the Project for such single vehicle crashes.	Unlikely - Once every five or ten years	Major	Medium
6	Existing phasing with filter right turns may lead to a risk in opposing vehicle turning crashes as a result of the Project.	Moderate - Once or more per year (but less than once per week)	Major	Medium
7				
8				

Intersection Name: **Toowoomba-Cecil Plains Road / McDougall Street**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Specific requirements for any upgrade or improved safety measures to be assessed during detail design and traffic management plan. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Unlikely - Once every five or ten years	Moderate	Medium
2	Upgrade intersection to allow for a signalised stand up left turn lane in line with TMR Safety Policy, 2018. Specific requirements to be determined and updated during detail design. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Rare - Less than once every ten years	Moderate	Low
3	Update existing line marking to adequately demarcate travel lanes and required longitudinal lines. Line marking to consist of cold applied plastic as per TMR Safety Policy, 2018. Specific requirements to be determined and updated during detail design. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Rare - Less than once every ten years	Moderate	Low
4	No action required, as risk score has not changed from the without development level.	Unlikely - Once every five or ten years	Major	Medium
5	No mitigation measures required for Project.	Unlikely - Once every five or ten years	Major	Medium
6	Filtered right turn phase to be replaced by leading right or diamond phasing arrangement to provide sufficient green time for each movement to operate safely. Specific requirements for any upgrade or improved safety measures to be assessed during detail design and traffic management plan. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Rare - Less than once every ten years	Moderate	Low

Intersection Name: **Toowoomba-Cecil Plains Road / Omara Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Existing sight lines considered insufficient to meet minimum requirements. Crash types such as rear end crashes and opposing turn crashes my be exacerbated as a result of the Project. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. However, sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Crash types such as opposing vehicle turning and rear-end crashes and opposing turn crashes my be exacerbated as a result of the Project.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Toowoomba-Cecil Plains Road / Omara Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Sight line enhancements required to meet minimum requirements of Safe Intersection Sight Distances (SISD) and Marginal Gap Acceptance Sight Distances (MGSD) where a minimum of 5 seconds of MGSD should be available. The extent and specifications of upgrade works to enhance sight lines should be captured during the detail design stage and should be appropriately suited to the most conservative design vehicle expected to use the intersection (driver eye height and object height requirements). Regular vegetation clearance and maintenance of the verge should also be carried out once upgrade works are complete.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Additional investigation required to reduce risk of closely spaced intersections. Specific requirements to be determined and updated during detail design. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Toowoomba-Cecil Plains Road / Toowoomba Bypass NB Ramps**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	There is no impact expected on existing single vehicle crashes as such crashes are considered to occur due to human behaviour.	Unlikely - Once every five or ten years	Major	Medium
2	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required due to signalised intersection form and based on Project peak hour traffic demands. SIDRA analysis results indicate sufficient level of service and minimal delay and queueing. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path would be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Warrego Highway / Chamberlain Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	This intersection has been modified to remove access between Jannushs Road and Chamberlain Road, removing the risk of this type of crash occurring again. Intersection form Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Possible impact on roadside infrastructure due to swept path requirements (refer to swept path drawings in the TIA report). Larger turn paths of OSOM vehicles may increase likelihood of intersection from adjacent approach and other crash types. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Project traffic may exacerbate the likelihood of rear-end crashes. Turn lane treatment of AUL(s) warranted for traffic flow.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Warrego Highway / Chamberlain Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium
2	Provide AUL(s) turn treatment. Specific requirements to be determined and updated during detail design. Road safety audits to be carried out at design stage and post-construction stage where such upgrade works are required.	Unlikely - Once every five or ten years	Major	Medium

Risk No.	Risk Item & Description	Risk Type (Existing / Proactive)	Likelihood	Consequence	Risk Score
1	No intersection from adjacent approach or other crashes recorded at intersection. Existing sight lines considered sufficient. Turn lanes not warranted to accommodate existing peak hour traffic demands. Refer to TIA report. The minor road approach has a tight horizontal alignment with no sharp curve chevron signage, advance speed warning signage or other warning or management signage.	Proactive	Rare - Less than once every ten years	Major	Medium

Intersection Name: **Newell Highway / River Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements. In addition the sharp curve and no provision of warning signage may increase the risk of run-off road on curve crashes.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Cemetery Road / Access Track**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements given the straight and relatively level alignments. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow, as such no impact on vehicle queueing and delay anticipated. The existing unpaved and unformed approaches of the intersection together with the T-formation of the intersection and no warning or advisory signage might exacerbate the likelihood of adjacent approach crashes, opposing vehicle turning crashes, run off road crashes and rear end crashes. This might be the result of heavy vehicle volumes travelling on surfaces where there are no skid resistance, sufficient lighting, advisory signage or traffic guidance measures.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Coolmunda Dam Access / Coolmunda Dam Access**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to enhance sight lines, in addition it is proposed to implement advance warning signage along Coolmunda Access south approach road indicating intersection ahead. Possible change to existing turn lane treatment type required. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan (TMP) from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable.TMP should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Sight line enhancements required to meet minimum requirements of Safe Intersection Sight Distances (SISD) and Marginal Gap Acceptance Sight Distances (MGSD) where a minimum of 5 seconds of MGSD should be available. The extent and specifications of upgrade works to enhance sight lines should be captured during the detail design stage and should be appropriately suited to the most conservative design vehicle expected to use the intersection (driver eye height and object height requirements). Regular vegetation clearance and maintenance of the verge should also be carried out once upgrade works are complete. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path might be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Kildonan Road / South Kurumbul Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments required based on Project peak hour traffic demands. right turn requires a CHR(s) treatment. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Mooroobie Lane / Cemetery Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements given the straight and relatively level alignments. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow, as such no impact on vehicle queueing and delay anticipated. The existing unpaved and unformed approaches of the intersection together with the T-formation of the intersection and no warning or advisory signage might exacerbate the likelihood of adjacent approach crashes, opposing vehicle turning crashes, run off road crashes and rear end crashes. This might be the result of heavy vehicle volumes travelling on surfaces where there are no skid resistance, sufficient lighting, advisory signage or traffic guidance measures.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Suttons Road / Access Track**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements given the straight and relatively level alignments. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow, as such no impact on vehicle queueing and delay anticipated. The existing unpaved and unformed approaches of the intersection might exacerbate the likelihood of adjacent approach crashes, opposing vehicle turning crashes, run off road crashes and rear end crashes. This might be the result of heavy vehicle volumes travelling on surfaces where there are no skid resistance, sufficient lighting, advisory signage or traffic guidance measures.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Suttons Road / Access Track**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Possible change to existing turn lane treatment type required. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan (TMP) from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable.TMP should reflect updated construction duration estimates and final peak hour volumes. Road safety audits to be carried out at design stage and post-construction stage where such road upgrade works are required. It is proposed to provide a suitable formed and graded gravel road consisting of a suitable width and crossfall to accommodate the required heavy vehicle volumes on all approaches to the intersection. Regular maintenance and grading would be required as well as dust suppression for the duration of construction activities. Priority control signage would be required on the minor road along with advanced waning signs indicating intersection ahead as well as speed limit signage.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **River Road / River Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn warrant analyses indicate the requirement for implementing turn lanes to accommodate peak hour traffic volumes. Crash types such as rear end crashes, intersection from adjacent approaches and opposing turn crashes my be exacerbated as a result of the Project. turn lane analyses indicate an upgrade from BAR to BAR(s), however the existing BAL would be sufficient. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Commodore Peak Road / Scragg Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Possible impact on roadside infrastructure due to swept path requirements (refer to swept path drawings in the TIA report). Scragg Road is an unformed gravel road closely spaced to the existing paved road intersection. This may create gravel spill over onto the existing paved road and close spacing to the existing intersection may increase the risk of queue spill back onto Millmerran Inglewood Road, should the rare likelihood occur that two construction vehicles need to enter at the same time. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to heavy vehicle turn movements.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Commodore Peak Road / Scragg Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required. Formalising minor road approach to a paved standard for at least the first 10m as per Austroads Guide to Road Design Part 4, Figure 7.4 with minimum width of 6-8m. Final details regarding kerb turnouts, kerb to kerb widths, entry and exit tapers line marking etc. to be determined during detail design. All conflict points impacting vehicle turn path (if any) to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path would be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland. Road safety audits to be carried out at design stage and post-construction stage where such road upgrade works are required. Scragg Road will need to be sufficiently spaced from Millmerran Inglewood Road intersection to allow for sufficient queue storage. This will be determined and designed for during detail design stages in line with relevant design guidelines and criteria.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Forestry Road / Access Track**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Forestry Road / Access Track**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Yarranlea Road / Desmonds Lane**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required based on Project peak hour traffic demands. Refer to TIA report Section 5.4.3 for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Project peak hour traffic demands increase the risk of rear end crashes occur due to more traffic. Likelihood stays at moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments not required due to signalised intersection form and based on Project peak hour traffic demands. SIDRA analysis results indicate sufficient level of service and minimal delay and queueing. All conflict points impacting vehicle turn path to be relocated / removed. Further road widening of kerb turnouts or carriageway of minor road to accommodate vehicle swept path would be required. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5m wide and 25m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Intersection Name: **Linthorpe Valley Road / Geitz Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

Intersection Name: **Barwon Highway / Silo Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Mitigation Measures	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines. Requirements for turn lane treatments to be finalised during detail design stage as well as updated during the construction stage. As per the earlier assessments, it is important that the routes are reviewed in the preparation of a Traffic Management Plan from a physical and safety perspective prior to the commencement of construction activities to ensure they are suitable. This should reflect updated construction duration estimates and final peak hour volumes. Not providing turn lanes may require additional mitigations such as adequate truck turn signage to be installed on approaches to intersection for duration of construction. Potential speed reduction (-10km/h) through intersection and advisory signage as required.	Unlikely - Once every five or ten years	Major	Medium

5					
6					
7					
8					

Intersection: **Cunningham Highway / Cemetery Road**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Sufficient sight distance would prevail to meet minimum design requirements. Turn treatments required based on Project peak hour traffic demands. Existing turn lanes which are evident at the intersection (CHR) would be sufficient to accommodate the increase in project traffic. Refer to TIA report for turn lane warrant analyses. Sufficient absorption capacity would be available to enter major stream of flow from side road, as such no impact on vehicle queueing and delay anticipated. Likelihood might change to moderate with the potential increase in intersection from adjacent approach crashes, opposing vehicle turning crashes and rear end crashes due to high speed environment.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Increased volumes due to Project peak hour traffic demands may increase queueing at adjacent level crossing, therefore increasing the risk of rear end collision by road vehicles not aware of level crossing status.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Two off carriageway on straight crashes resulting in one hospitalisation and one minor injury. Hospitalisation occurred in clear, dark conditions where vehicle went off path to the right. Minor injury occurred in clear, day light with vehicle went off path to the left of carriageway.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Existing high speed environment with no median or centreline treatment. Casualty crash risks are higher on undivided roads, with no median for head-on crashes.	Proactive	Rare - Less than once every ten years	Major	Medium
3	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
4	Single vehicle off carriageway on straight hit object crash resulting in fatality. Crash occurred in clear, night time conditions with no lighting, travelling left off carriageway. Existing road condition may have contributed to crash.	Existing	Unlikely - Once every five or ten years	Extreme	Medium
5	Two single vehicle off carriageway on straight hit object crashes resulting in hospitalisation. Crashes occurred in clear conditions with no lighting travelling right off rural carriageway. One occurred in day time and one at night. Existing road condition and driveway visibility may have contributed to crash.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium
5	Single vehicle off carriageway on straight hit object crash resulting in hospitalisation. Crash occurred in clear, night time conditions with no lighting travelling left off carriageway.	Existing	Unlikely - Once every five or ten years	Major	Medium
7	One off carriageway on curve hit object crash resulting in a fatality. Crash occurred in clear daylight conditions.	Existing	Unlikely - Once every five or ten years	Extreme	Medium
8

Road Name and Section: **River Road, Newell Highway to Boggabilla Weir Access**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with narrow carriageway. This may lead to single vehicle and two vehicle crashes. There is currently no road-side shoulder available and carriageway width is narrow <6 m and as such, run-off road crash risk is increased on roads with shoulder widths less than 1 m.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standard design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with narrow carriageway. This may lead to single vehicle and two vehicle crashes. There is currently no road-side shoulder available and carriageway width is narrow <6 m and as such, run-off road crash risk is increased on roads with shoulder widths less than 1 m.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. If no sealing is warranted, road should be designed and formalised to a suitable gravel road standard. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standard design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium

Road Name and Section: **Cunningham Highway (17D), Ch. 40.5 to Ch. 43.9**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with dashed line marking. Casualty crash risks are higher on undivided roads, with no median for head-on crashes, although traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One single vehicle crash consisting of off path on straight which overturned, resulting in hospitalisation. The crash occurred during clear conditions at dusk. Vehicle lost control on straight.	Existing	Unlikely - Once every five or ten years	Major	Medium

Road Name and Section: **Cunningham Highway (17D), Ch. 40.5 to Ch. 43.9**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on passing opportunities on roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. Likelihood might change to moderate, although the relatively flat and level alignment of the road allows for good passing sight distances.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic is not expected to exacerbate the existing occurrence of such single vehicle crashes. Likelihood and consequence to remain unchanged.	Unlikely - Once every five or ten years	Major	Medium

Road Name and Section: **Suttons Road, B2G-LDN030.0 to Access Track (Off Suttons Road)**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed gravel road with narrow widths and no median. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	The gravel road section traverses around a few sharp horizontal curves where no speed limit or traffic guidance signage is evident. This may have a risk of off carriageway on curve crashes.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Suttons Road, B2G-LDN030.0 to Access Track (Off Suttons Road)**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk of crashes on gravel roads where dust build up impact visibility, loose gravel limit available traction, higher speeds and side friction around curves limit vehicle control. Additional traffic might also impact road condition such as gravel loss. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Additional Project traffic and heavy vehicle configuration may impact on roll over threshold around sharp horizontal curves where no speed or chevron warning signage is available. This may increase risk of off carriageway on curve crashes.	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. If no sealing is warranted, road should be designed and formalised to a suitable gravel road standard. Regular road grading maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standard design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium
3	Requirement to provide speed warning and chevron signage to be determined during detail design in line with MUTCD Part 2 criteria.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Cunningham Highway (17D), Ch. 27.1 to Ch. 29.3**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on passing opportunities on roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. Likelihood might change to moderate, although the relatively flat and level alignment of the road allows for good passing sight distances with no-passing zones adequately line marked.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic is not expected to exacerbate the existing occurrence of such single vehicle crashes, however might change the likelihood should vehicles park in the narrow roadside shoulder while wider heavy vehicles due to the Project traverse the road network. Likelihood might change to unlikely.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
4	Project traffic is not expected to exacerbate the existing occurrence of such single vehicle crashes. Likelihood and consequence to remain unchanged.	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium
3	Standard mitigation measures relating to Safe Vehicle Specifications, Fatigue Management, etc. as described in the TIA Report Section 5 would manage the likelihood of risk impact as a result of the Project.	Unlikely - Once every five or ten years	Moderate	Medium
4	No mitigation required.	Unlikely - Once every five or ten years	Major	Medium

6					
7					
8					

Road Name and Section: **Cunningham Highway (17D), Ch. 13.9 to Ch. 18.5**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on passing opportunities on roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. Likelihood might change to moderate, although the relatively flat and level alignment of the road allows for good passing sight distances.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Additional mass and energy of Project traffic on the road network may increase the likelihood of such existing crashes during conditions where visibility is low and where private driveways intersect with the main road. Likelihood is anticipated to increase to moderate.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
3	The Cunningham Highway level crossing will be used by IR trains accsesing the proposed Whestone Material Distribution Centre. The construction traffic increases volumes on this road from 681 veh/day/direction to 912 veh/day/direction (38.2 % increase) in the peak impact year. It is expected that only trains relating to the IR construction will use this crossing due to its proximity to Whetstone (end of the line).	Unlikely - Once every five or ten years	Major	Medium

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium
3	During detailed design, when the proposed traffic volumes are confirmed, an ALCAM may be recommended to be undertaken in order to determine whether the existing passive level crossing treatment is sufficient for the increased traffic volumes. Refer to TIA Report Section 5 for standard mitigation measures relating to maintaining of clear zones, sight lines and contractor specific TMP, TGS requirements.	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Cremascos Road, B2G-LDN055.4 to B2G-LDN054.2**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with narrow carriageway and median. This may lead to single vehicle and two vehicle crashes. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. Run-off road crash risk is increased on narrow roads with less than 6 m width.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3. Use pilot vehicle and police escorts to warn opposing vehicles where loads are greater than 3.5 m wide and 25 m long. Additional pilot/escort and/or police escorts are required as per section 6.3 of the Guideline for Excess Dimension Vehicles in Queensland or the Critical Areas and Roads in Queensland for Vehicles/Combinations Requiring Pilot/Escort map, or a police permit when accompanying an oversize vehicle or combination. Travel outside of peak times, perhaps in the evenings or early mornings to avoid other vehicular conflict. All other safety aspects treating OSOM movements to be in accordance with the Guideline for Excess Dimension Vehicles in Queensland.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

8					

Road Name and Section: **Cunningham Highway (17D), Ch. 3.9 to Ch. 10.2**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on passing opportunities on roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle activity on narrow roads may increase the likelihood of crashes. Likelihood might change to moderate, although the relatively flat and level alignment of the road allows for good passing sight distances.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Moderate	Medium
4	Project traffic may have an impact on such crash types where vehicles turn into and out of side road accesses and project traffic continues straight. Additional mass of heavy vehicles require additional reaction and deceleration times. Likelihood is expected to increase.	Moderate - Once or more per year (but less than once per week)	Major	Medium
5	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Moderate	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with dashed line marking. Casualty crash risks are higher on undivided roads, with no median for head-on crashes, although traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Cunningham Highway (17D), Ch. 2.0 to Ch. 3.9**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on passing opportunities on roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle activity on narrow roads may increase the likelihood of crashes. Likelihood might change to moderate, although the relatively flat and level alignment of the road allows for good passing sight distances.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millmerran-Inglewood Road (337), Ch. 65.7 to Ch. 68.7**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with an 8 m wide carriageway. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Wongavale Yugilbar Road, Millmerran - Inglewood Road to B2G-LDN081.0**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millmerran-Inglewood Road (337), Ch. 37.7 to Ch. 39.8**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with an 8 m wide carriageway. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millmerran-Inglewood Road (337), Ch. 33.0 to Ch. 35.6**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on crashes. OSOM movements would also impact on safety as slow speeds and wide loads may encroach the road verge / on-street parking lanes and increase vehicle time spent following with overtaking related crashes. Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millwood Road, B2G-LDN112.1 to Millwood Road**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a narrow carriageway and poor pavement condition by visual observations. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - With Inland Rail Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on crashes. OSOM movements would also impact on safety as slow speeds and wide loads may encroach the road verge / on-street parking lanes and increase vehicle time spent following with overtaking related crashes. Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millmerran-Inglewood Road (337), Ch. 13.1 to Ch. 14.0**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 10 m wide carriageway. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millmerran-Inglewood Road (337), Ch. 13.1 to Ch. 14.0**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on crashes. OSOM movements would also impact on safety as slow speeds and wide loads may encroach the road verge / on-street parking lanes and increase vehicle time spent following with overtaking related crashes. Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 7 m wide carriageway. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millmerran-Inglewood Road (337), Ch. 2.5 to Ch. 3.5**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Campbell Street, Millmerran - Inglewood Road to Saleyards Road**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with 9 m wide carriageway. Road link is only a short section around a horizontal curve, however approach sight distances are considered sufficient and horizontal alignment radius sufficient for the implemented posted speed and design speed.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **West Street, Gore Highway to Florence Street**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with 24 m wide carriageway with central median. On-street parking is evident and allowed for which may have a risk on on-street parking related crashes. Multiple driveways obtain direct access from road link which has a risk of driveway exit related crashes. Various commercial and residential uses along the road link would generate pedestrian volumes walking and crossing at numerous locations which may have an impact on pedestrian crashes.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Millmerran - Leyburn Road (335), Ch. 0.0 to Ch. 2.0**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a narrow carriageway with no line marking and no shoulders. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - With Inland Rail Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	No infrastructure upgrade related mitigation measures required. Refer to TIA Report Section 5 for standard mitigation measures relating to maintaining of clear zones, sight lines and contractor specific TMP, TGS requirements and OSOM movements to be implemented for the duration of construction works.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium
3	No mitigation required.	Unlikely - Once every five or ten years	Major	Medium
4	No mitigation required.	Unlikely - Once every five or ten years	Major	Medium
5	No mitigation required to address current crash type however standard mitigation measures as indicated in the TIA Report Section 5 will be implemented regarding management plans, measures, vehicle safety specifications, safe following distances etc. for the contractor to adhere to for the duration of construction.	Unlikely - Once every five or ten years	Minor	Low

Road Name and Section: **Fysh Road, B2G-LDN147.1 to Gore Highway**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a narrow carriageway with no line marking and no shoulders. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Dieckmann Road, Precast Concrete Facility and Concrete Batch Plant North to B2G-LDN150.5**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a narrow carriageway (5 m) with no line marking and no shoulders. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road does not have a road shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 10 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One single vehicle off path on curve which resulted in vehicle overturning with medical treatment as consequence. Crash occurred in darkness conditions	Existing	Unlikely - Once every five or ten years	Moderate	Medium
4	Multi-vehicle rear-end crash in the same direction of travel resulting from a vehicle decelerating and needing to turn left into side road and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance.	Existing	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unsealed road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Gore Highway (28A), Ch. 19.0 to Ch. 20.3**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle will also have an impact due to larger and heavier loads being transported which may encroach opposing direction and road verge. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic may exacerbate such existing crashes at the crash location due to an increase in vehicle volume. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Minor	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 9 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does meets the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd, however, no overtaking barrier line marking is provided and existing crashes negligible to warrant WCLT.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 9 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd, however, no overtaking barrier line marking is provided and existing crashes negligible to warrant WCLT.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	Multi-vehicle rear-end crash in the same direction of travel resulting from a vehicle decelerating and needing to turn left into side road and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance.	Existing	Unlikely - Once every five or ten years	Minor	Low
4	Two (2) Multi-vehicle (opposing vehicles turning) crashes which occurred in clear daylight conditions. Crash resulted in hospitalisation and included an opposing through-right crash. Existing sight distances are considered sufficient along the road link to observe approaching vehicles before making turn movements.	Existing	Unlikely - Once every five or ten years	Major	Medium
5	Multi-vehicle head-on crash in opposite directions of travel which resulted in medical treatment. Crash occurred during clear daylight on a straight section of road where sufficient sight distance prevails. Likely cause may be inadequate visibility / driver confusion when overtaking.	Existing	Unlikely - Once every five or ten years	Moderate	Medium
6	Two (2) Multi-vehicle rear-end crash in the same direction of travel resulting from a vehicle decelerating and needing to turn left into left turn slip lane and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance.	Existing	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 9 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One single vehicle out of control on curve crash resulting in vehicle overturning and fatality. Crash occurred during darkness with possibility of cause being driver behaviour / fatigue.	Existing	Unlikely - Once every five or ten years	Extreme	Medium
4	Multi-vehicle head-on crash in opposite directions of travel which resulted in a fatality. Crash occurred during clear daylight on a straight section of road where sufficient sight distance prevails with solid barrier line marking. Likely cause may be inadequate visibility / opposing traffic lane encroachment.	Existing	Unlikely - Once every five or ten years	Extreme	Medium
5	One hit animal crash which occurred during darkness resulting in minor injury.	Existing	Unlikely - Once every five or ten years	Minor	Low
6					
7					
8					

Road Name and Section: **Gore Highway (28A), Ch. 11.2 to Ch. 15.3**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle will also have an impact due to larger and heavier loads being transported which may encroach opposing direction and road verge. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Extreme	Medium
4	Project traffic may increase such crash types where additional heavy vehicle volumes on the road may increase the need for overtaking. Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Extreme	High
5	Project traffic are not expected to have an impact on such existing single vehicle crashes, however crashes with animals may increase as Project related traffic increase. Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Minor	Medium
6

Road Name and Section: **Gore Highway (28A), Ch. 11.2 to Ch. 15.3**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	No infrastructure upgrade related mitigation measures required. Refer to TIA Report Section 5 for standard mitigation measures relating to maintaining of clear zones, sight lines and contractor specific TMP, TGS requirements and OSOM movements to be implemented for the duration of construction works.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium
3	No mitigation required.	Unlikely - Once every five or ten years	Extreme	Medium
4	WCLT is proposed to be implemented along this section of road due to the high risk rating and existing crash severity increase being High. In addition standard mitigation measures as indicated in the TIA Report Section 5 will be implemented regarding contractor required management plans, night and day-time TGS, vehicle safety specifications, safe following distances etc. for the contractor to adhere to for the duration of construction. WCLT warrant not met.	Unlikely - Once every five or ten years	Extreme	Medium
5	No mitigation required.	Unlikely - Once every five or ten years	Minor	Low

Road Name and Section: **Bushy Lane, B2G-LDN183.0 to Gore Highway**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unsealed road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 9 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd, however, no overtaking barrier line marking is provided and existing crashes negligible to warrant WCLT.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One multi-vehicle angle crash in dry daytime conditions resulting in medical treatment.	Existing	Unlikely - Once every five or ten years	Moderate	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 9 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd, however, no overtaking barrier line marking is provided and existing crashes negligible to warrant WCLT.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	Multi-vehicle rear-end crash in the same direction of travel during darkness resulting from queueing at portable traffic lights during construction work. Crash may be the result of inadequate visibility duirng night time to observe vehicle queueing.	Existing	Unlikely - Once every five or ten years	Moderate	Medium

Road Name and Section: **Gore Highway (28A), Ch. 2.2 to Ch. 5.4**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle will also have an impact due to larger and heavier loads being transported which may encroach opposing direction and road verge. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic not expected to impact such crash types at the given location as a result of completed road works.	Unlikely - Once every five or ten years	Moderate	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 9 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and asociated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd, however, no overtaking barrier line marking is provided and Existing crashes negligable to warrant WCLT.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	Multi-vehicle rear-end crash in the same direction of travel resulting from a vehicle decelerating and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions and resulted in medical treatment. Crash may be the result of inadequate following distance / slow driver reaction times due to fatigue / driver not observing decelerating vehicle.	Existing	Unlikely - Once every five or ten years	Moderate	Medium

Road Name and Section: **Toowoomba-Cecil Plains Road (324), Ch. 10.3 to Ch. 12.1**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle will also have an impact due to larger and heavier loads being transported which may encroach opposing direction and road verge. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic may increase such crash types at side road intersections where separate turn lanes are not provided (low volume roads). Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 8 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and asociated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd, however, overtaking opportunities are managed by longtitudinal line marking and Existing crashes negligable to warrant WCLT.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One single vehicle out of control on curve crash resulting in vehicle hitting an object with hospitalisation. Crash occurred during dawn/dusk with possibility of cause being driver behaviour / fatigue/ speeding.	Existing	Unlikely - Once every five or ten years	Major	Medium
4	Multi-vehicle head-on crash in opposite directions of travel which resulted in hospitalisation. Crash occurred during dusk/dawn on a straight section of road where sufficient sight distance prevails with passing opportunity. Likely cause may be inadequate visibility / opposing traffic lane encroachment.	Existing	Unlikely - Once every five or ten years	Major	Medium
5	Multi-vehicle head-on crash in opposite directions of travel which resulted in medical treatment. Crash occurred during clear daylight on a straight section of road where sufficient sight distance prevails with passing opportunity. Likely cause may be inadequate visibility / opposing traffic lane encroachment.	Existing	Unlikely - Once every five or ten years	Moderate	Medium
6	Multi-vehicle rear-end crash in the same direction of travel resulting from a vehicle decelerating and needing to turn right into side road and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance / slow driver reaction times due to fatigue / driver not observing stopped vehicle.	Existing	Unlikely - Once every five or ten years	Major	Medium

OSOM vehicle will also have an impact due to larger and heavier loads being transported which may encroach opposing direction and road verge. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Moderate	Medium
4	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 7 m wide carriageway and no shoulder shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has no shoulder which may have an impact on available vehicle recovery area and asociated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One Multi-vehicle (opposing vehicles turning) crashes which occurred in clear daylight conditions. Crash resulted in hospitalisation and included an opposing through-right crash. Existing sight distances are considered sufficient along the road link to observe approaching vehicles before making turn movements.	Existing	Unlikely - Once every five or ten years	Major	Medium
4

6					
7					
8					

Road Name and Section: **Toowoomba-Cecil Plains Road (324), Ch. 8.3 to Ch. 9.2**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic may increase such crash types at side road intersections where light vehicles may take gaps in the traffic stream at less than required headway gap acceptance standards (driver behaviour). Crashes may increase to moderate likelihood.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Road Name and Section: **Steger Road, Warrego Highway to New Hope Recycled Water Pipeline**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 8 m wide carriageway and no shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Chamberlain Road, Warrego Highway to B2G-LDN204.2**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Kingsthorpe Haden Road, Kingsthorpe Haden Overpass to Warrego Highway**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 7 m wide carriageway and no shoulder. Two sideswipe crashes recorded in the last five years. One crash resulted in hospitalisation and the other resulted in minor injury. Both crashes happened during clear daylight conditions. The road has a narrow shoulder, which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a variation of carriageway width, designed to standards. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd, however, WCLT and median barriers are provided along the road link including guardrails along both sides of the roadside shoulder. Multiple lanes per direction might increase the risk on side swipe, rear end or overtaking same direction crashes.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One single vehicle out of control on straight crash resulting in vehicle hitting an object with hospitalisation as consequence. Crash occurred during dawn/dusk with possibility of cause being driver behaviour / fatigue/ speeding.	Existing	Unlikely - Once every five or ten years	Major	Medium
4	Multi-vehicle head-on crash in opposite directions of travel which resulted in hospitalisation. Crash occurred during clear daylight on a curved section of road where a motorcycle collided with a car. Likely cause may be travelling on wrong side of road as a median barrier is provided.	Existing	Unlikely - Once every five or ten years	Major	Medium
5	Multi-vehicle rear-end crash in the same direction of travel resulting from a vehicle decelerating and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance / slow driver reaction times due to fatigue / driver not observing stopped vehicle.	Existing	Unlikely - Once every five or ten years	Major	Medium
6	Multi-vehicle rear-end crash in the same direction of travel resulting from a vehicle decelerating and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance / slow driver reaction times due to fatigue / driver not observing stopped vehicle.	Existing	Unlikely - Once every five or ten years	Major	Medium

Road Name and Section: **Toowoomba - Athol Road (316), Ch. 2.1 to Ch. 16.8**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a variation of carriageway width, designed to standards with the average being 9 m wide. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	Five (5) Multi-vehicle (intersecting from adjacent approach) crashes have occurred on the road link. The crashes included 3 medical treatment and 2 hospitalisation. Existing sight distances are considered sufficient along the road link to observe approaching vehicles before making turn movements.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium
4	One multi-vehicle head-on crash in opposite directions of travel which resulted in hospitalisation. Crash occurred during clear daylight on a straight section of road where sufficient sight distance prevails with solid barrier line marking. Likely cause may be inadequate visibility / opposing traffic lane encroachment.	Existing	Unlikely - Once every five or ten years	Major	Medium
5	Three (3) Multi-vehicle (opposing vehicles turning) crashes have occurred on the road link. The crashes included 1 medical treatment and 2 hospitalisation. Existing sight distances are considered sufficient along the road link to observe approaching vehicles before making turn movements.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium
6	Seven (7) rear end crashes occurred on the road link mainly as a result of numerous driveways accessing the road link and vehicles slowing down / stopping to access the driveways and through movement vehicles colliding with stopped vehicles. This mainly occurs along one lane per direction sections.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium
7	Two (2) single vehicle out of control on straight crashes resulting in vehicle hitting an object with hospitalisation and medical treatment as consequence. Possibility of cause being driver behaviour / fatigue/ speeding.	Existing	Unlikely - Once every five or ten years	Major	Medium
8	Two (2) single vehicle out of control on curve crashes resulting in hospitalisation and medical treatment as consequence. Possibility of cause being driver behaviour / fatigue/ speeding.	Existing	Unlikely - Once every five or ten years	Moderate	Medium
9	Three (3) single vehicle off carriageway on curve crashes resulting in vehicle hitting an object with hospitalisation and medical treatment as consequence. Possibility of cause being driver behaviour / fatigue/ speeding.	Existing	Unlikely - Once every five or ten years	Major	Medium
10	Two (2) other related crashes such as vehicle leaving driveway with hospitalisation and medical treatment as result.	Existing	Unlikely - Once every five or ten years	Major	Medium

Road Name and Section: **Toowoomba - Athol Road (316), Ch. 2.1 to Ch. 16.8**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic is not expected to have an impact of worsening of existing safety conditions. However, likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic may increase such crash types at side road intersections where light vehicles may take gaps in the traffic stream at less than required headway gap acceptance standards (driver behaviour). Crashes may increase to likely.	Likely - Once or more per week	Major	High
4	Project traffic may increase such crash types where additional heavy vehicle volumes on the road may increase the need for overtaking. Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
5	Project traffic may increase such crash types at side road intersections where light vehicles may take gaps in the traffic stream at less than required headway gap acceptance standards (driver behaviour). Crashes may increase to likely.	Likely - Once or more per week	Major	High
6	Rear-end crashes may be exacerbated as a result of the Project due to slower moving vehicles requiring longer stopping distances and faster reaction times when travelling behind light vehicles wanting to enter driveways / accesses. Likelihood may increase to likely.	Likely - Once or more per week	Major	High
7	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
8	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Moderate	Medium
9	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
10	Such crashes may be exacerbated as a result of the Project due to slower moving vehicles requiring longer stopping distances and faster reaction times when vehicles leave driveways at less than required gap acceptance standards (5 seconds). Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Road Name and Section: **Toowoomba - Athol Road (316), Ch. 2.1 to Ch. 16.8**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	No infrastructure upgrade related mitigation measures required. Refer to TIA Report Section 5 for standard mitigation measures relating to maintaining of clear zones, sight lines and contractor specific TMP, TGS requirements to be implemented for the duration of construction works.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium
3	No mitigation required to address current crash type however standard mitigation measures as indicated in the TIA Report Section 5 will be implemented regarding management plans, measures, vehicle safety specifications, safe following distances etc. for the contractor to adhere to for the duration of construction.	Moderate - Once or more per year (but less than once per week)	Major	Medium
4	No mitigation required to address current crash type however standard mitigation measures as indicated in the TIA Report Section 5 will be implemented regarding contractor required management plans, night and day-time TGS, vehicle safety specifications, safe following distances etc. for the contractor to adhere to for the duration of construction. WCLT warrant not met.	Unlikely - Once every five or ten years	Major	Medium
5	No mitigation required to address current crash type however standard mitigation measures as indicated in the TIA Report Section 5 will be implemented regarding management plans, measures, vehicle safety specifications, safe following distances etc. for the contractor to adhere to for the duration of construction.	Moderate - Once or more per year (but less than once per week)	Major	Medium
6	No mitigation required to address current crash type however standard mitigation measures as indicated in the TIA Report Section 5 will be implemented regarding management plans, measures, vehicle safety specifications, safe following distances etc. for the contractor to adhere to for the duration of construction.	Moderate - Once or more per year (but less than once per week)	Major	Medium
7	No mitigation required.	Unlikely - Once every five or ten years	Major	Medium
8	No mitigation required.	Unlikely - Once every five or ten years	Moderate	Medium
9	No mitigation required.	Unlikely - Once every five or ten years	Major	Medium
10	No mitigation required to address current crash type however standard mitigation measures as indicated in the TIA Report Section 5 will be implemented regarding management plans, measures, vehicle safety specifications, safe following distances etc. for the contractor to adhere to for the duration of construction.	Unlikely - Once every five or ten years	Major	Medium

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standarad design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standarad design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Silo Street, Barwon Highway to Graincorp Talwood**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 7 m wide carriageway and no shoulder. Casualty crash risks are higher on narrow roads. This may lead to single vehicle and two vehicle crashes. Traffic volume likely not to meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Silo Street, Barwon Highway to Graincorp Talwood**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Thornton Road, B2G-LDN069.0 to B2G-LDN067.6**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
