1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standarad design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is an unformed gravel road with narrow widths and no median. Unformed roads may have vegetation encroachment, and poor drainage. This may lead to single vehicle and two vehicle crashes. Unsealed roads have a risk of loose material, poor surface conditions, dust and drainage issues which may contribute to crashes. The risk of fatal and serious injury run-off road and head-on crashes increases with traffic volume.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Gilgai Lane, B2G-LDN144.6 to Gore Highway**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle will also have an impact due to larger and heavier loads being transported which may encroach opposing direction and road verge. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Gilgai Lane, B2G-LDN144.6 to Gore Highway**

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standarad design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Owens Scrub Road, B2G-LDN128.2 to B2G-LDN130.0**

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 8 m wide carriageway and no shoulder. Casualty crash risks are higher on narrow roads. This may lead to single vehicle and two vehicle crashes. Traffic volume likely not to meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium

Road Name and Section: **Owens Scrub Road, B2G-LDN128.2 to B2G-LDN130.0**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. OSOM vehicle will also have an impact due to larger and heavier loads being transported which may encroach opposing direction and road verge. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	Assessment of the traffic volume required to determine if sealing the road and/or shoulders is required. Potential treatments of line marking delineation or edge lines should be considered during road safety audit on detailed design. Regular maintenance and vegetation clearance to be carried out to maintain adequate sight lines and maintain clear zones. Requirements for road upgrades such as, grading and gravel standarad design, sealing, installation of drainage infrastructure, clear zone creation, to be finalised during detailed design stage as well as updated during the construction stage and as per contract required risk assessments when preparing appropriate TMP and TGS documents, also in accordance with the Manual of Uniform Traffic Control Devices: Part 3 – Works on Roads' and TMR's specification "MRTS02 – Provision for traffic" requirements. This should reflect updated construction duration estimates and final peak hour volumes. Possible TMP mitigations may include speed reductions and advisory signage, and should be placed as per MUTCD Part 3.	Unlikely - Once every five or ten years	Major	Medium
2	No mitigation required.	Rare - Less than once every ten years	Major	Medium

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Risk Type (Existing/Proactiv	Likelihood	Consequence	Risk Score
1	Segment is a formed sealed road with a 6 m wide carriageway and narrow shoulder. Casualty crash risks are higher on undivided roads, with no median for head-on crashes. The road has a narrow shoulder which may have an impact on available vehicle recovery area and associated rear end crashes and off carriageway crashes. Traffic volume does not meet the TMR warrants for Wide Centre Line Treatment (WCLT) of 4,000 vpd.	Proactive	Rare - Less than once every ten years	Major	Medium
2	All accesses and intersections along the section would have sufficient gap acceptance to turn into or across the main road to maintain a 5 second headway gap acceptance. Refer to TIA Report Section 5 for details. Existing risk likelihood is considered rare.	Proactive	Rare - Less than once every ten years	Major	Medium
3	One single vehicle off carriageway on straight crash hitting an object in clear, dry conditions during darkness / night which resulted in hospitalisation.	Existing	Unlikely - Once every five or ten	Major	Medium
4	One single vehicle off carriageway on straight crash hitting an object in clear, dry conditions during darkness / night which resulted in hospitalisation.	Existing	Unlikely - Once every five or ten	Major	Medium
5	One single vehicle off path on curve crash resulting in vehicle hitting an object with fatality as consequence. Crash occurred in clear daylight conditions.	Existing	Unlikely - Once every five or ten	Extreme	Medium
6	One single vehicle off carriageway on straight crash and hitting an object in clear, dry conditions during darkness which resulted in hospitalisation.	Existing	Unlikely - Once every five or ten years	Major	Medium
7	One vehicle struck by external load of another vehicle, resulting in minor injury. Crash occurred during clear daylight conditions.	Existing	Unlikely - Once every five or ten	Minor	Low
8	Multi-vehicle rear-end crash in the same direction of travel requiring medical treatment resulting from a vehicle decelerating and needing to turn left into side road and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance.	Existing	Unlikely - Once every five or ten years	Moderate	Medium
9	Multi-vehicle (opposing vehicles turning) crash which occurred in clear daylight conditions. Crash resulted in hospitalisation and included an opposing through-right crash. Existing sight distances are considered sufficient along the road link to observe approaching vehicles before making turn movements.	Existing	Unlikely - Once every five or ten years	Major	Medium
10	One single vehicle out of control on straight crash and overturning during clear dawn/dusk conditions which resulted in hospitalisation.	Existing	Unlikely - Once every five or ten	Major	Medium
11	One single vehicle out of control on straight crash and overturning during clear daylight which resulted in hospitalisation.	Existing	Unlikely - Once every five or ten	Major	Medium
12	One single vehicle out of control on straight crash and overturning during clear, wet conditions in darkness which resulted in hospitalisation.	Existing	Unlikely - Once every five or ten years	Major	Medium
13	Three single vehicle off path on straight crashes during clear, dry conditions in daylight which resulted in hospitalisation. Two vehicles travelled left off of carriageway with one travelling right off the road, all hitting object.	Existing	Moderate - Once or more per year (but less than once	Major	Medium
14	One single vehicle travelling right off carriageway on straight crash and overturning during clear, dry conditions during daytime which resulted in hospitalisation.	Existing	Unlikely - Once every five or ten years	Major	Medium
15	Multi-vehicle rear-end crash in the same direction of travel requiring medical treatment resulting from a vehicle decelerating and needing to turn into side road and other vehicle traversing straight. Crash occurred during dry and clear daylight conditions. Crash may be the result of inadequate following distance.	Existing	Unlikely - Once every five or ten years	Moderate	Medium

Road Name and Section: **Gore Highway (28B), Ch. 13.0 to Ch. 121.6**

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Likelihood	Consequence	Risk Score
1	Additional traffic will increase the risk on narrow roads, and is likely to have an impact on the surface condition of the road, increasing the possibility of crashes. Likelihood might change to moderate.	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Sufficient gap acceptance will prevail even with the impact of the Project. Likelihood is considered to remain rare.	Rare - Less than once every ten years	Major	Medium
3	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
4	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
5	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Extreme	Medium
6	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
7	Project traffic is not expected to exacerbate such crash types. However, construction traffic may carry loads with unusual dimensions and as such adequate safety measures will need to be adhered to regarding operating	Unlikely - Once every five or ten years	Minor	Low
8	Project traffic may increase such crash types at side road intersections where separate left turn lanes are not provided (low volume roads). Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium
9	Project traffic may increase such crash types at side road intersections where light vehicles may take gaps in the traffic stream at less than required headway gap acceptance standards (driver behaviour). Crashes may increase to moderate likelihood.	Moderate - Once or more per year (but less than once per week)	Major	Medium
10	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
11	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
12	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road in proximity to crash location is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
13	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road in proximity to crash location is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Moderate - Once or more per year (but less than once per week)	Major	Medium
14	Project traffic not expected to exacerbate such single vehicle crashes. Existing horizontal alignment of road in proximity to crash location is appropriate to accommodate required design speed. No change in severity or likelihood expected.	Unlikely - Once every five or ten years	Major	Medium
15	Project traffic may increase such crash types at side road intersections where separate left turn lanes are not provided (low volume roads). Likelihood may increase to moderate.	Moderate - Once or more per year (but less than once per week)	Moderate	Medium

Alderley Street, Toowoomba - Athol Road to Condamine Street **Level Crossing ID: Alderley Street_Toowoomba**

Construction Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Likelihood	Consequence	Risk Score
1	Vehicle queueing related crashes may be exacerbated by the Project at the existing active level crossing which will include very low construction vehicle volumes. Sufficient sight and stacking distance is available to accommodate for the largest design vehicle 36.5m Road Train. As per AS1742.7 a distance comprising the design vehicle plus a safety factor of 5 m stopped at the intersection without fouling the tracks is required. Stacking of >200m is available. Existing stacking is sufficient which would have no impact on crashes with railway train or vehicle from opposing direction crashes.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	Likelihood of crashes may increase as a result of the Project due to increased volumes and exposure. Likelihood may increase to moderate.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium

Construction Stage

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Risk Type (Existing/Proactive)	Likelihood	Consequence	Risk Score
1	Queuing at passive control level crossing may result in rear end collision by road vehicles not aware of level crossing status or where sight lines are obstructed. The existing available sight distance is considered insufficient to meet minimum requirements given the unsealed road and associated horizontal alignment. Exisitng stacking distance is however considered sufficient.	Existing	Proactive	Rare - Less than once every ten years	Major	Medium
2	No existing crashes recorded at the level crossing in the last 5 years indicating a low crash probability.	Existing	Exisitng	Rare - Less than once every ten years	Major	Medium

Construction Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Likelihood	Consequence	Risk Score
1	Vehicle queueing related crashes or collision with trains may be exacerbated by the Project at the existing passive level crossing based on the existing road alignment, unsealed pavement and insufficient sight distance available to approaching vehicles. However sufficient stacking distance is available to accommodate for the largest design vehicle 36.5m Road Train. As per AS1742.7 a distance comprising the design vehicle plus a safety factor of 5 m stopped at the intersection without fouling the tracks is required. Stacking of >200m is available. Existing stacking is sufficient which would have no impact on crashes with railway train or vehicle from opposing direction crashes. Due to the existing geometry and sight lines crashes may change to likely.	Existing	Likely - Once or more per week	Major	High
2	Likelihood of crashes may increase as a result of the Project due to increased volumes and exposure. Likelihood may increase to moderate.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium

Construction Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	The proposed upgraded treatment of the crossing will be a passive control crossing with formalising of the approach roads to required geometrical standards. The crossing will also be temporarily closed during the construction stage to upgrade the crossing to the required standards of AS1742.7. The upgraded crossing will allow for sufficient safety features. In addition, road safety audits will also be required to be undertaken based on the design and based on as-constructed conditions. Refer to traffic report for details.	Unlikely - Once every five or ten years	Major	Medium
2	Standard mitigation measures in combination with the temporary closure to upgrade the crossing would reduce the likelihood and exposure.	Rare - Less than once every ten years	Major	Medium

Construction Stage

Risk Assessment: Peak Impact Year - With Inland Rail Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	The proposed treatment of the crossing will be active control. No infrastructure mitigation measures required. The Traffic Management Plan (TMP) will also be developed prior to the commencement of construction with mitigation measures included to supplement the EMP. Road safety audits will also be required to be undertaken based on the design and based on as-constructed conditions. Refer to traffic report Section 5.9.3 for details.	Rare - Less than once every ten years	Not significant	Low

1	The location of the crossing is proposed to be shifted along with road re-alignment works. As such the existing crossing will be closed for the duration of construction works while the new crossing is implemented. As such no impact of the Project on the safety conditions of the existing level crossing is expected.	Existing	Rare - Less than once every ten years	Not significant	Low
2	No impact on the existing level crossing as a result of the Project and associated works.	Existing	Rare - Less than once every ten years	Not significant	Low

Construction Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	The proposed upgraded treatment of the crossing will be an active control crossing with a new location and road re-alignment works to the required standards of AS1742.7 and road design guidelines. The upgraded crossing will allow for sufficient safety features. In addition, road safety audits will also be required to be undertaken based on the design and based on as-constructed conditions. Refer to traffic report for details. No mitigation measures are required for the existing crossing location.	Rare - Less than once every ten years	Not significant	Low
2	Standard mitigation measures in combination with the temporary closure to upgrade the crossing would reduce the likelihood and exposure.	Rare - Less than once every ten years	Not significant	Low

1	Queuing at passive control level crossing may result in rear end collision by road vehicles not aware of level crossing status or where sight lines are obstructed. The existing available sight distance as well as stacking distance is considered sufficient. Crossing to be proposed as a new crossing thus no exisitng safety risks are anticipated.	Proposed	Proactive	Rare - Less than once every ten years	Not significant	Low

Operational Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic (Trains)

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Likelihood	Consequence	Risk Score
1	The additional Project traffic (trains) traversing through the level crossing may increase wait times and subsequent vehicle queueing. The design vehicle is considered to be a 19 Semi-trailer. Additional queueing might have an impact on increase in rear end crashes. Queueing throughout the analyses years will be minimal, sufficient queue storage is available on the approach road and offset from adjacent intersection which may also increase likelihood of crashes with through movement vehicles on main road.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium
2	The introduction of a level crossing might exacerbate the existing safety conditions as a control / conflict point will be introduced to the public road. This may lead to rear end or train collision crashes should drivers be unaware of the new crossing and not expecting stationary queued vehicles on the road. However, sufficient approach sight distance is considered to be available to drivers to observe the crossing and sufficient queue storage is available to contain the expected queued vehicles. Level crossing is located in a rural area. The omission of any advanced warning signage may have an impact on rear end crashes of vehicles queued at level crossing and crashes with railway train or railway infrastructure.	Proposed	Moderate - Once or more per year (but less than once per week)	Major	Medium

Operational Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	It is also proposed to implement a left turn slip lane to allow for additional queue storage. All necessary safety conditions will be adhered to.	Unlikely - Once every five or ten years	Major	Medium
2	The absolute minimum treatment required at any railway crossing where there is provision for motor vehicles to cross the railway shall be the RX-1 or RX-2 assembly comprising the railway crossing position sign R6-25, and the GIVE WAY or STOP sign. The level crossing will be designed to the required standards of AS1742 as well as the road infrastructure (Austroads Guidelines) with all warning and vehicle guidance signage implemented. Carry out updated vehicle queueing and delay assessments of new level crossings during detailed design stage to account for induced traffic demands, ALCAM assessments to be carried out during detailed design of all public road level crossings based on proposed designs, road safety audits to be carried out at design stage and post-construction stage where such level crossings are proposed. Continuous monitoring and evaluation required with incident mitigation for the entire duration of operation.	Moderate - Once or more per year (but less than once per week)	Major	Medium

Operational Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic (Trains)

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Likelihood	Consequence	Risk Score
1	The additional Project traffic (trains) traversing through the level crossing may increase wait times and subsequent vehicle queueing. The design vehicle is considered to be a 36.5m Road Train. Additional queueing might have an impact on increase in rear end crashes. Queueing throughout the analyses years will be minimal and sufficient queue storage is available on the approach road and offset from adjacent intersection.	Existing	Unlikely - Once every five or ten years	Major	Medium
2	The introduction of a level crossing might exacerbate the existing safety conditions as a control / conflict point will be introduced to the public road. This may lead to rear end or train collision crashes should drivers be unaware of the new crossing and not expecting stationary queued vehicles on the road. However, sufficient approach sight distance is considered to be available to drivers to observe the crossing and sufficient queue storage is available to contain the expected queued vehicles. Level crossing is located in a rural area. The omission of any advanced warning signage may have an impact on rear end crashes of vehicles queued at level crossing and crashes with railway train or railway infrastructure.	Proposed	Moderate - Once or more per year (but less than once per week)	Major	Medium

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Likelihood	Consequence	Risk Score
1	The additional Project traffic (trains) traversing through the level crossing may increase wait times and subsequent vehicle queueing. The design vehicle is considered to be a 36.5m Road Train. Additional queueing might have an impact on increase in rear end crashes. Queueing throughout the analyses years will be minimal and sufficient queue storage is available on the approach road and offset from adjacent intersection.	Existing	Unlikely - Once every five or ten years	Major	Medium
2	The introduction of a level crossing might exacerbate the existing safety conditions as a control / conflict point will be introduced to the public road. This may lead to rear end or train collision crashes should drivers be unaware of the new crossing and not expecting stationary queued vehicles on the road. However, sufficient approach sight distance is considered to be available to drivers to observe the crossing and sufficient queue storage is available to contain the expected queued vehicles. Level crossing is located in a rural area. The omission of any advanced warning signage may have an impact on rear end crashes of vehicles queued at level crossing and crashes with railway train or railway infrastructure.	Proposed	Moderate - Once or more per year (but less than once per week)	Major	Medium

Operational Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	The absolute minimum treatment required at any railway crossing where there is provision for motor vehicles to cross the railway shall be the RX-1 or RX-2 assembly comprising the railway crossing position sign R6-25, and the GIVE WAY or STOP sign. The level crossing will be designed as active control to the required standards of AS1742 as well as the road infrastructure (Austroads Guidelines) with all warning and vehicle guidance signage implemented. Carry out updated vehicle queueing and delay assessments of new level crossings during detailed design stage to account for induced traffic demands, ALCAM assessments to be carried out during detailed design of all public road level crossings based on proposed designs, road safety audits to be carried out at design stage and post-construction stage where such level crossings are proposed. Continuous monitoring and evaluation required with incident mitigation for the entire duration of operation.	Unlikely - Once every five or ten years	Major	Medium
		Moderate - Once or more per year (but less than once per week)	Major	Medium

Operational Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Likelihood	Consequence	Risk Score
1	The crossing will be relocated with a new road interface and as active control. The additional Project traffic (trains) traversing through the level crossing may increase wait times and subsequent vehicle queueing. The design vehicle is considered to be a 36.5m Road Train. Additional queueing might have an impact on increase in rear end crashes. Queueing throughout the analyses years will be minimal and sufficient queue storage is available on the approach road and offset from adjacent intersection.	Existing	Unlikely - Once every five or ten years	Major	Medium
2	The introduction of a level crossing might exacerbate the existing safety conditions as a control / conflict point will be introduced to the public road. This may lead to rear end or train collision crashes should drivers be unaware of the new crossing and not expecting stationary queued vehicles on the road. However, sufficient approach sight distance is considered to be available to drivers to observe the crossing and sufficient queue storage is available to contain the expected queued vehicles. Level crossing is located in a rural area. The omission of any advanced warning signage may have an impact on rear end crashes of vehicles queued at level crossing and crashes with railway train or railway infrastructure.	Existing	Moderate - Once or more per year (but less than once per week)	Major	Medium

Operational Stage

Risk Assessment: Peak Impact Year - Without Development Traffic

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Risk Type (Existing/Proactive)	Likelihood	Consequence	Risk Score
1	Road along level crossing will consist of active control along a paved road. Crossing to be proposed as a new crossing thus no existing safety conditions / impacts identified with respect to crashes.	Proposed	Proactive	Rare - Less than once every ten years	Not Significant	Low
2	Existing road is free-flow without any control points, vehicle conflict locations at the given location apart from the existing safety conditions identified through the road link analyses.	Proposed	Proactive	Rare - Less than once every ten years	Major	Medium
4						
5						
6						
7						

Operational Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic

Risk No.	Risk Item & Description	Crossing Type (Proposed/Existing)	Likelihood	Consequence	Risk Score
1	The additional Project traffic (trains) traversing through the level crossing may increase wait times and subsequent vehicle queueing. The design vehicle is considered to be a 26m B-Double. Additional queueing might have an impact on increase in rear end crashes. Queueing throughout the analyses years will be minimal and sufficient queue storage is available on the approach road and offset from adjacent intersection.	Existing	Unlikely - Once every five or ten years	Major	Medium
2	The introduction of a level crossing might exacerbate the existing safety conditions as a control / conflict point will be introduced to the public road. This may lead to rear end or train collision crashes should drivers be unaware of the new crossing and not expecting stationary queued vehicles on the road. However, sufficient approach sight distance is considered to be available to drivers to observe the crossing and sufficient queue storage is available to contain the expected queued vehicles. Level crossing is located in a rural area. The omission of any advanced warning signage may have an impact on rear end crashes of vehicles queued at level crossing and crashes with railway train or railway infrastructure.	Proposed	Moderate - Once or more per year (but less than once per week)	Major	Medium
4					
5					
6					
7					

Operational Stage

Risk Assessment: Peak Impact Year - With B2G Development Traffic and Mitigation Measures

Risk No.	Impact on Crash Risk Item	Likelihood	Consequence	Risk Score
1	The absolute minimum treatment required at any railway crossing where there is provision for motor vehicles to cross the railway shall be the RX-1 or RX-2 assembly comprising the railway crossing position sign R6-25, and the GIVE WAY or STOP sign. The level crossing will be designed as active control to the required standards of AS1742 as well as the road infrastructure (Austroads Guidelines) with all warning and vehicle guidance signage implemented. Carry out updated vehicle queueing and delay assessments of new level crossings during detailed design stage to account for induced traffic demands, ALCAM assessments to be carried out during detailed design of all public road level crossings based on proposed designs, road safety audits to be carried out at design stage and post-construction stage where such level crossings are proposed. Continuous monitoring and evaluation required with incident mitigation for the entire duration of operation.	Unlikely - Once every five or ten years	Major	Medium
2		Moderate - Once or more per year (but less than once per week)	Major	Medium

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
