Executive summary

Objectives

The purpose of this report is to detail the implementation of the Sampling and Analysis Plan and characterise the contamination status of the sediments within the proposed Channel Duplication area to be dredged (the investigation area). The objectives of this investigation are:

- Undertake sediment sampling, analysis and reporting in accordance with the approved Sampling and Analysis Plan
- Provide a statistically valid assessment of the material to be dredged to meet the minimum sampling requirements for the investigation area and estimated dredging volume under the National Assessment Guidelines for Dredging (NAGD) (2009)
- Analysis of the sediments within the investigation area for a range of physical and chemical parameters and comparison of contaminant concentrations against the NAGD (2009) and other relevant guideline criteria
- Determine the suitability of the material to be dredged for offshore dredged material placement or reclamation activities
- Support the Environmental Impact Statement for the Port of Gladstone Gatcombe and Golding Cutting Channel Duplication Project.

Methodology

The site investigation was carried out by Aurecon in accordance with the approved Sampling and Analysis Plan (refer Appendix A), NAGD (2009) requirements, relevant legislation, standards and guidelines. The geochemical investigation was undertaken between 2 February and 28 February 2015.

A total of 78 locations within the investigation area were drilled and assessed during the investigation.

A vibrocorer, operated by Seas Offshore aboard the vessel “Shackleton”, was used to collect sediment cores at 63 locations. A hand-held GPS device was used to position the vessel within 10m of each sample location. Sediment cores were cut into 1.0m lengths, split horizontally, photographed and logged prior to sampling.

Sediment samples were also taken at 15 additional locations in the underlying consolidated natural geological materials, in conjunction with the geotechnical investigation drilling undertaken using the Ocean Driller II jack-up barge, between 9 March and 4 May 2015.

The primary analysis of sediment samples was conducted by ALS Environmental with Eurofins as the secondary laboratory to analyse inter-laboratory duplicate samples. Both laboratories are NATA accredited for the analytical methods used.

Results

Where guideline value exist under NAGD (2009), an assessment against these was undertaken. Where no values are present under NAGD (2009), a comparison against locally derived reference

values and other locally derived reference data (equivalent to the NAGD (2009) term regional ambient baseline levels) was undertaken.

The 95% upper confidence level (UCL) of all parameters analysed were below the relevant NAGD (2009) screening levels. A small number of arsenic, chromium and nickel samples demonstrated concentrations slightly above the NAGD screening levels; however, none of these exceedances were recorded at levels greater than their respective NAGD high levels.

Manganese was also recorded at elevated concentrations within the samples. While the deeper sediments did report a 95% UCL for manganese that was higher than the 500mg/kg EIL, these concentrations are likely to be naturally occurring and are consistent with levels previously reported within the Port Curtis area in previous studies (e.g. Angel et al. 2012; GHD 2009a), below values observed by Anastasi and Wilson (2010) in Port Curtis of up to 9,000mg/kg, and below the average abundance for manganese (850mg/kg) observed in Australian soils (AusIMM 2011).

Dioxin concentrations detected across Port Curtis were below the Dutch Intervention Levels and the Canadian sediment quality guidelines. In addition, dioxin concentrations were consistent with previous testing undertaken by Department of Environment and Heritage Protection (EHP) in 2012 and were typical of estuaries around Australia when compared with the National Dioxins Program (Müller et al. 2004).

The investigation also identified the presence of acid sulfate soils within a small portion of the investigation area.

Conclusions

Geochemical results from this investigation have demonstrated that the sediment from the investigation area and the area to be dredged is **clean** as per NAGD (2009) and is therefore chemically suitable for unconfined dredged material placement at sea and is chemically suitable for placement within a reclamation area within or adjoining Port Curtis. Therefore, further testing such as elutriates and bioavailability testing is not required.

The appraisal of laboratory and field QA/QC procedures and assessments indicates that the results comply with the NAGD (2009) requirements. The analytical results are therefore representative of the physical and chemical characteristics of the sediment.

Compliance of the Project geochemical investigation with the approved SAP and NAGD (2009) is demonstrated by:

- Drilling and sampling has been undertaken to full depth of sediment that has the potential to be contaminated (0.3m below seabed surface)
- Physical testing of the consolidated natural geological materials has occurred as part of the concurrent geotechnical investigation to determine particle size distribution (PSD) to input into hydrodynamic modelling and potential water quality impact assessment (i.e. turbidity movement and behaviours of the dredged material sediment)
- Sampling used vibrocoring process, a NAGD recognised approved device for undertaking geochemical sampling. Grab sampling was undertaken where refusal occurred at the surface of the seabed and no sample was retrieved from the vibrocore barrel.
- Additional sediment sampling and laboratory analysis for metals and metalloids was undertaken in the underlying consolidated natural geological materials, in conjunction with the geotechnical investigation in 15 additional locations (above the 63 locations within the approved SAP) to collect information on metals and metalloids that have previously been demonstrated to be naturally occurring within Port Curtis.

1 Introduction

1.1 Background

The Port of Gladstone is located along the Capricorn Coast of Central Queensland, approximately 525km north of Brisbane. The outer Port limits extend east of Port Curtis, past the adjoining Curtis and Facing Islands. The southern Port limits extend to the northern tip of Hummock Hill Island, near Tannum Sands, and the northern Port limit is located within the upper sections of an estuarine passage known as The Narrows. The main shipping entrance to the Port enters in at the southern extent, through the Boyne River estuary, and onto Fisherman's Landing.

The Port of Gladstone is Queensland's largest multi-commodity port, with RG Tanna Coal Terminal in the 2013/14 reporting period being the world's fourth largest coal export terminal (by throughput) in the world. Cumulatively, the Port handles the export of mineral resources from Central Queensland and products from local industries, and the import of raw materials from national and international sources (GPC 2014).

The Port of Gladstone is also one of the busiest ports in Australia, vital to the local, state and national economies. Major exports from the Port include coal, alumina, cement, petroleum, aluminium and agricultural resources.

Gladstone Ports Corporation (GPC) is responsible for the control and management of port infrastructure and cargo handling operations for coal and other products at the Port of Gladstone, Port of Rockhampton and Port of Bundaberg. GPC provides and maintains vital shipping channels within the Port and is responsible for the development, management and leasing of Strategic Port Land (SPL). GPC is also directly responsible for road infrastructure, pilotage services, towage services (through an exclusive licence), property services on SPL, community parklands, quarantine and waste disposal services and the Gladstone Marina.

GPC has identified the need to duplicate the existing Gatcombe and Golding Cutting shipping channels to accommodate a predicted increase in shipping traffic as a result of ongoing industrial growth within the Port. The duplicate channels are proposed to be developed adjacent to the existing shipping channel, facilitating two-way shipping traffic from the outer harbour.

1.2 Environmental impact statement

The proposed Gatcombe and Golding Cutting Channel Duplication Project (herein referred to as 'the Project') was declared a 'coordinated project' by the Queensland Coordinator-General (CG) under the *State Development and Public Works Organisation Act 1971* (SDPWO Act) on 25 September 2012. The Project was also determined to be a 'controlled action' requiring an Environmental Impact Statement (EIS) by the Commonwealth Minister for the Environment under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) on 23 October 2012.

GPC is currently proceeding with the EIS phase of the Project. The EIS will be submitted for assessment to both the Queensland State Government under the SDPWO Act and the Commonwealth Department of the Environment (DoE) under the EPBC Act. The Project originally had the potential to undertake activities (e.g. placement of dredged material) within the Great Barrier Reef Marine Park (GBRMP), which are assessable under the *Great Barrier Reef Marine Park Regulations 1983* (GBRMP Reg).

1.3 Dredging and dredged material placement

1.3.1 Dredging

The dredging component of the Project involves the duplication of the existing Gatcombe and Golding Cutting shipping channels that will provide a duplicate channel parallel to the main shipping channel, facilitating two-way passage. The location of the investigation area for the Channel Duplication Project is shown in Figure 1.1.

The proposed duplicate channel will be approximately 14km long and dredging is proposed to be undertaken to an ultimate depth of -16.1 metres (m) lowest astronomical tide (LAT), with a channel width (toe to toe) of 200m (refer Figure 1.1). The channel area is approximately 382 hectares (ha), however, due to the existing bathymetry in the Port of Gladstone, the total area requiring dredging (i.e. above -16.1m LAT) is less, being 247.8ha. This equates to approximately 12.6Mm^3 of seabed material (including dredging tolerance) requiring removal and placement during the project.

Two dredging and placement campaign options are proposed and will be selected upon availability of dredging equipment and operations within the Port of Gladstone. The likely volumes and timing of each campaign option are outlined in Table 1.1.

Table 1.1 Dredging campaign and staging options, location and volumes

Stage	Location	Timeframe – likely start date or later (duration)	Design depth (m LAT)	Volume (Mm^3)*	Disturbance area to be dredged (ha)
Option 1 – two staged dredging campaign					
1	Gatcombe and Golding Cutting Channels	Q4 2018 or later (12 months)	-13.5	7.25	179.6^
2	Gatcombe and Golding Cutting Channels	2022 or later (8 months)	-16.1	5.35	247.8
Option 2 – one stage dredging campaign					
-	Gatcombe and Golding Cutting Channels	Q4 2018 or later (20 months)	-16.1	12.6	247.8

Table notes:

* Includes 0.3m (depth) allowance for average dredging tolerance

^ Different disturbance area to be dredged as part of Option 1, Stage 1 is due to some parts of the channels already being equal to or deeper than -13.5m

Q4 = fourth quarter of a calendar year (i.e. October to December)

There is the potential for the commencement of dredging to be after 2018, subject to actual and predicted Port throughput and associated vessel movements over the next 5 to 10 years.

1.3.2 Dredging methodology

The dredging methodology adopted for the Project will be subject to the Maritime Safety Queensland (MSQ) Regional Harbour Master acceptance of the successful dredging contractor's detailed execution plan. The dredging contractor will also comply with MSQ's Standard for Marine Construction Activities within Gladstone Harbour (DTMR 2012).

Sampling and Analysis Plan Implementation Report (area to be dredged)

Figure 1.1: Project investigation area

A combination of different dredging vessels are likely to be used for the Project, including:

- Trailing suction hopper dredger (TSHD)
- Cutter suction dredger (CSD).

The preferred method of dredging and size/capacity of the dredger equipment are dependent on a number of factors, which will have implications on how the material can be dredged, transported and placed at the preferred dredged material placement location, including:

- Design of the area to be dredged
- Nature of material to be dredged (e.g. the stiffness of material)
- Quantities of materials to be dredged
- Depth of water (i.e. to maintain the vessel's required underkeel clearance)
- Sea conditions (e.g. wind, waves, currents)
- Environmental considerations
- Distance, availability and accessibility of dredged material placement location
- Maintaining navigability of existing shipping channels
- Required schedule
- Equipment availability.

1.3.3 Dredged material placement

This investigation assessed four potential dredged material placement areas (DMPAs), which are outlined in Table 1.2 and presented in Figure 1.2, and include:

- East Banks Expansion DMPA – at sea placement within Port limits
- West Banks Island DMPA – island reclamation
- Port Central Expansion DMPA – land based and intertidal reclamation
- Western Basin Expansion DMPA – intertidal reclamation.

Table 1.2 Summary of potential DMPAs

DMPA	Placement type	Location
East Banks Expansion DMPA	Offshore (at sea)	Within Port limits and outside the Great Barrier Reef Marine Park (GBRMP) and extends from the boundary of the existing East Banks DMPA to the north, east and west
West Banks Island DMPA	Island reclamation	Between Boyne Island and the Gatcombe Channel, to the south of the existing shipping channel. Southeast of the South Trees Wharves and Boyne Wharf.
Port Central Expansion DMPA	Land based and intertidal reclamation	South of the existing Barney Point Wharf and Coal Terminal, the Barney Point residential area of Gladstone and north of QAL located at Parsons Point. It is to the south of the existing Auckland Channel and north of South Trees Wharves.
Western Basin Expansion DMPA	Intertidal reclamation	North of the existing Western Basin reclamation area and south of the Narrows

For Port Central Expansion DMPA, only the sediments below highest astronomical tide (HAT) were assessed during the Project geochemical investigation. The sediments and soils within the area above HAT (i.e. the upper intertidal and terrestrial portions of the DMPA) will be assessed during a separate investigation.

1.4 Purpose of this report

A Sampling and Analysis Plan (SAP) for the investigation area and area to be dredged as part of the Project, has been approved by the Commonwealth DoE and the Queensland Department of Environment and Heritage Protection (EHP) and is provided in Appendix A.

Sampling and Analysis Plan Implementation Report (area to be dredged)

Figure 1.2: Dredged Material Placement Options

The purpose of this report is to detail the implementation of the SAP and characterise the contamination status of the sediments within the area to be dredged (the investigation area). The objectives of the sediment investigation are to:

- Undertake sediment sampling, analysis and reporting in accordance with the approved SAP
- Provide a statistically valid assessment of the material to be dredged to meet the minimum sampling requirements for the investigation area and estimated volume to be dredged under the National Assessment Guidelines for Dredging (NAGD) (2009)
- Analysis of the sediments within the investigation area for a range of physical and chemical parameters and comparison of contaminant concentrations against the NAGD (2009) and other relevant guideline criteria
- Determine the suitability of the material to be dredged for offshore dredged material placement or reclamation activities
- Support the EIS.

This SAP Implementation Report addresses Phase II – sampling and analysis of sediments as detailed in NAGD (2009).

A separate implementation report has been prepared for the sediment characterisation at the potential DMPAs.

1.5 Sediment investigation framework

1.5.1 Summary

The assessment of Project data has been undertaken in a staged process. This is to comply with NAGD (2009) where a contaminant does not have a screening level and to account for placement of dredged material in a reclamation. The sediment investigation framework staged process included:

- A compliance assessment undertaken for potential contaminants of concern, where guideline values exist under NAGD (2009)
- Where no guideline values exist under NAGD (e.g. iron), a comparison against locally derived reference values and other locally derived reference data was undertaken. This is in compliance with the NAGD (2009) requirement that where contaminants are identified for which there are no screening levels, these contaminant concentrations should be compared against regional ambient baseline levels.
- A comparison against terrestrial background values, such as QLD Draft Guidelines for the Assessment & Management of Contaminated Land in Queensland (both background and EILs), Australasian Institute of Mining & Metallurgy (background range) and the Dutch Intervention Levels was undertaken.

Further detail is provided in the sections below.

1.5.2 Guidelines

Where guidelines values exist, such as NAGD (2009), a compliance assessment against these guideline values will be undertaken.

1.5.2.1 National Assessment Guidelines for Dredging (NAGD)

The objective of the NAGD (2009) is to apply a regulatory framework to ensure the impacts of dredged material loading and dredged material placement are adequately assessed and, when offshore dredged material placement is permitted, that impacts are managed responsibly and effectively.

Where NAGD (2009) provides guideline values for potential contaminants of concern, an assessment of the data has been undertaken against these values.

NAGD (2009) provides screening levels for a range of contaminants, based on the interim sediment quality guidelines (ISQGs) developed by ANZECC/ARMCANZ (2000) and updated by Simpson et al. (2008; 2013). If the 95% upper confidence limit (UCL) of a contaminant exceeds the specified screening level, it is considered a contaminant of potential concern and requires further investigation.

Where contaminants exceed the Sediment Quality Guidelines – High (SQG – High), the sediment is considered to be significantly contaminated with a consequent risk of bioaccumulation in invertebrates. In this instance, bioaccumulation testing will be required.

A chemical analysis of the sediments within the investigation area compared against NAGD (2009) is provided in Section 4.

1.5.3 Locally derived reference values

NAGD (2009) states that where contaminants are found for which there are no screening levels, these contaminant concentrations should be compared against regional ambient baseline levels. The sections below summarise existing locally derived reference values for Port Curtis, which are consistent with NAGD (2009) defined regional ambient baseline levels.

1.5.3.1 Port Curtis Integrated Monitoring Program

The Port Curtis Integrated Monitoring Program (PCIMP) was established in 2001 as a consortium of members from 16 bodies representing industry, government (both local and state), research institutions and other stakeholders to develop a cooperative monitoring program for assessing the ecosystem health of Port Curtis, and to ensure the environmental sustainability of the Port of Gladstone.

To help assess the ecosystem health of Port Curtis, sediments were sampled every three years by PCIMP (2011). Water quality was assessed more frequently as contaminants in sediment are less dynamic than those in water and are therefore unlikely to change in the short term. Samples were analysed for metals and nutrients with results used as a background measurement for ecosystem health within Port Curtis.

The ecosystem health (EH) values for sediment were derived from the 95th percentile of background data collected during the PCIMP monitoring and the worst case scenario (WCS) values are 10 times the EH values (PCIMP 2011). The PCIMP EH values have been adopted by this investigation as locally derived reference values where no NAGD (2009) screening levels are provided.

1.5.3.2 Metal Concentrations in the Waters and Sediments of Port Curtis, Queensland

Angel et al. (2012) conducted an investigation of water and sediment quality within Port Curtis on behalf of the Commonwealth Scientific and Industrial Research Organisation (CSIRO). Results were collected from 6 to 8 December 2011 from 21 sites within the general area of Port Curtis, the southern Narrows and Rodds Bay, with more detailed sampling in the vicinity of Western Basin and the liquefied natural gas (LNG) facilities (Angel et al. 2012). Samples were collected from the surface sediments using a stainless steel Van Veen grab sampler.

Results from this investigation have been adopted as locally derived reference values where no NAGD (2009) screening levels are provided, including aluminium, iron, cobalt, manganese, selenium and vanadium.

1.5.3.3 Report for Western Basin Dredging and Disposal Project – Sediment Quality Assessment

GHD (2009a) conducted the sediment quality assessment for the Western Basin Dredging and Disposal Project (WBDDP). Sampling was conducted within the Western Basin area between 16 November 2008 and 17 June 2009 using a combination of vibrocoring, push tubes, standard

penetration tests and rotary drilling methods. Boreholes were drilled to various depths, ranging from 5.3 to -22.4m LAT, and over 1,000 sediment samples were collected (GHD 2009a).

Results from this investigation have been adopted as locally derived reference values where no NAGD (2009) screening levels are provided, including aluminium, iron, cobalt, manganese, selenium and vanadium.

1.5.3.4 National Dioxins Program

There are no guideline values for dioxins or dioxin-like chemicals in sediments in Australia. However, under the National Dioxins Program (Müller et al. 2004), 75 sediment samples collected from 62 locations across Australia were analysed for dioxins and dioxin-like chemicals. These sediment samples were distributed within different aquatic environments (i.e. fresh, estuarine and marine), various States and Territories, and different land uses (i.e. urban/industrial, agricultural and remote).

The National Dioxins Program reported concentrations of dioxins and dioxin-like chemicals as the sum of tetra- to octachlorinated PCDD/PCDF concentrations (Müller et al. 2004).

The National Dioxins Program provides a national baseline for dioxins and dioxin-like chemicals in sediments against which results from this investigation can be compared.

1.5.4 Terrestrial background values

A comparison against terrestrial background values was also undertaken for manganese and dioxins. Manganese is a naturally occurring metal in Port Curtis, which means it is not of anthropogenic origins in Port Curtis, and the source of the manganese is from geologic formations (i.e. Wandilla Formation) which occur in both upstream terrestrial and marine environments in Port Curtis. Terrestrial background values representative for Queensland and Australia are therefore considered acceptable for comparison against Project data as a regional ambient baseline level (as defined in NAGD (2009)).

There are no Australian guidelines for dioxins in soils/sediments and as such, the Dutch Intervention Levels have been used to determine potential dioxin contamination in the sediments and the risk to human health and the environment.

Terrestrial background values are also considered appropriate for this Project as dredged material will be placed in a reclamation area for this Project.

1.5.4.1 Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland

The Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (Environmental Protection Agency (EPA) 1998) were adopted for manganese as no NAGD screening level exists. While these guidelines were developed to provide best practice for managing land contamination, the Environmental Investigation Levels (EILs) have been adopted for comparison with manganese concentrations in conjunction with ambient background levels from the Port of Gladstone. The EIL for manganese was also previously adopted by the WBDDP.

1.5.4.2 Field Geologists' Manual

The Australasian Institute of Mining & Metallurgy (AusIMM) (2011), *Field Geologist's Manual,* Fifth Edition, provides the average abundance of various metals and metalloids in Australian soils. These values have been adopted as a terrestrial background value where no NAGD (2009) screening levels are provided.

1.5.4.3 Dutch Intervention Levels

The Dutch Target and Intervention Values, produced by the Dutch Ministry of Housing, Spatial Planning and the Environment (2000), provide an indication of when the functional properties of the

soil for humans, plant and animal life is seriously impaired or threatened. They are representative of the level of contamination above which there is a serious case of soil contamination.

The Dutch Target and Intervention Values provide the following concentrations for various contaminants:

- Background concentrations in soil and groundwater
- Target values for soil and groundwater to indicate the level at which there a sustainable soil quality
- Intervention levels where there is a serious case of soil or groundwater contamination

Given dredged material will be placed in a reclamation area for this Project, and an absence of locally derived reference values for dioxins, the Dutch Target and Intervention Values provide the most relevant guideline value for dioxin concentrations.

1.5.5 Adopted guidelines

Table 1.3 outlines the guideline values adopted for sediment quality during this investigation. Locally derived reference values and terrestrial background values are provided in Table 3.1.

Table 1.3 Sediment quality guidelines

Chemical	Units	NAGD (2009) screening level[1]	NAGD (2009) high level[1]
Aluminium	mg/kg	-	-
Iron	mg/kg	-	-
Antimony	mg/kg	2	25
Arsenic	mg/kg	20	70

Xylene	µg/kg	-	-

Table notes: [1] Values provided in brackets represent revised sediment quality values as provided in Simpson et al. (2013) (unpublished)
[2] For comparison to revised sediment quality values (Simpson et al. 2013), concentrations were normalised to 1.0% total organic carbon

1.5.6 Acid sulfate soils

The Guidelines for Sampling and Analysis of Lowland Acid Sulfate Soils (ASS) in Queensland 1998 (Ahern et al. 1998) outlines action criteria at which there is a significant environmental risk from ASS. Table 1.4 details the action criteria, which is dependent on the clay content of the sediment and the volume of sediment disturbed. Given the quantity of material to be dredged, the most conservative action criteria was used during this assessment.

Table 1.4 Action criteria for ASS analysis

Sediment type	Clay content (%)	Action criteria (1-1,000 tonnes disturbed)		Action criteria (>1,000 tonnes disturbed)	
		Sulfur trail (%S oxidisable)	Acid trail (mol H^+/tonne)	Sulfur trail (%S oxidisable)	Acid trail (mol H^+/tonne)
Coarse (sand – gravel)	≤ 5	0.03	18	0.03	18
Medium (sandy loam – light clay)	5-40	0.06	36	0.03	18
Fine (medium to heavy clay)	≥ 40	0.1	62	0.03	18

1.6 Data quality objectives and indicators

1.6.1 Data quality objectives

Data quality objectives (DQOs) are qualitative and quantitative statements derived from the outputs of the first six steps of the seven step DQO process that:

- Clarify the study objective

- Define the most appropriate type of data to collect
- Determine the most appropriate conditions from which to collect data
- Specify tolerable limits on decision errors which are used as the basis for establishing the quantity and quality of data needed to support the decision.

The DQO process (AS4482.1-2005) follows a systematic approach for defining the criteria that a data collection design should satisfy, including the number of samples and when, where and how to collect these samples. DQOs are employed to develop a scientific and resource-effective data collection design to assure decision makers that the type, quantity and quality of environmental data are appropriate for the intended application. In addition, decision makers guard against committing sources to data collection efforts that do not support defensible decisions.

The DQOs for this SAP have been developed to define the type and quality of data required to achieve the Project geochemical investigation objectives stated in Section 0. The DQOs were selected with reference to relevant guidelines published by the NAGD (2009) and the ANZECC/ARMCANZ (2000), which define minimum data requirements and quality control procedures.

These matters are addressed in the seven step DQO approach presented in Table 1.5.

Table 1.5 Data quality objectives

Process	Response
Step 1: State the Problem	The contamination status of the material to be dredged is required to be assessed in accordance with the requirements outlined in the NAGD (2009)
Step 2: Identify the Decision	The principle objectives of this report are as follows: ■ Undertake sediment sampling, analysis and reporting in accordance with the approved SAP ■ Provide a statistically valid assessment of the material to be dredged to meet the minimum sampling requirements for the investigation area and estimated volume to be dredged under NAGD (2009) ■ Analysis of the sediments within the investigation area for a range of physical and chemical parameters and comparison of contaminant concentrations against the NAGD (2009) and other relevant guideline criteria ■ Determine the suitability of the material to be dredged for offshore dredged material placement or reclamation activities ■ Support the EIS
Step 3: Identify the Inputs to the Decision	■ Dredging design depth and volume ■ Previous investigations within the Port of Gladstone ■ Industries and potential pollutant sources within the Port of Gladstone ■ History of dredging and sea dumping within the Port of Gladstone ■ Field data and laboratory analysis ■ Adopted guideline criteria for sediments
Step 4: Define the Boundaries of the Study	The ultimate design depth of the area to be dredged is -16.1m LAT, which defines the boundaries of the area to be dredged (refer Figure 1.1)
Step 5: Develop a Decision Rule	The assessment programme has been designed to characterise the sediments to be dredged using the sediment quality guideline criteria outlined in Section 1.5.3

Process	Response
Step 6: Specify Tolerable Limits on Decision Errors	The data quality indicators (DQIs) have been established to set acceptance limits on field and laboratory data collected during the investigation
Step 7: Optimise the Design for Obtaining Data	The SAP was developed in accordance with the NAGD 2009. Nominated samples judged as being representative of sediment values were submitted for analysis. Samples were analysed by a National Association of Testing Authorities (NATA) accredited laboratory within approved sample withholding times.

1.6.2 Data quality indicators

The DQIs for the assessment are presented in Table 1.6.

Table 1.6 Data quality indicators

DQI	Field	Laboratory	Acceptability limits
Completeness	■ Sediment to be dredged may pose a potential risk to health, safety and the environment and requires investigation to characterise and assess the suitability for dredged material placement ■ Appropriate sampling procedures to be used ■ Experienced field team to undertake sampling ■ Correct documentation to be completed	■ All required samples analysed ■ Appropriate methods ■ Appropriate limits of reporting (LORs) ■ Appropriate practical quantification limits (PQLs) ■ Sample documentation correct ■ Sample holding times in compliance	As per NAGD (2009) and Simpson et al. (2013) (unpublished)
Comparability	■ Correct sample procedures used at each location ■ Experienced field team ■ Same type (medium, volume and sampling technique) of samples collected	■ Same analytical methods used ■ Appropriate LORs ■ Samples submitted to the same NATA accredited laboratory ■ Analytical data is presented in the same unit	As per NAGD (2009)
Representativeness	■ Appropriate media sampled ■ All media identified (i.e. sediment)	■ All required samples analysed	As per NAGD (2009)
Precision	■ Correct sample procedures used at each location ■ Collection of appropriate quality assurance (QA) and quality control (QC) samples	Analysis of: ■ Duplicate samples ■ Laboratory duplicate samples	Relative percent deviation (RPD) or relative standard deviation (RSD) of 30-50%

DQI	Field	Laboratory	Acceptability limits
Accuracy	■ Sampling procedures appropriate and complied with ■ Collection of appropriate QA/QC samples	Analysis of: ■ Method blanks ■ Laboratory surrogate spikes ■ Laboratory control samples ■ Reference material	■ Non-detect for contaminants of concern ■ 70-130%

2 Methodology

2.1 Sampling and Analysis Plan

The SAP for the Project was approved by DoE on 19 June 2014 and by EHP on 27 May 2014. Sampling and analysis of sediments was undertaken in accordance with the approved SAP and NAGD (2009) requirements. The approved SAP is provided in Appendix A.

2.2 Fieldwork programme

The initial geochemical sediment investigation was undertaken between 2 February and 28 February 2015. A summary of the programme of works is provided in Table 2.1.

Table 2.1 Programme of works

Activity	Date
Mobilisation	2 February 2015
Inductions	2 February 2015 (and ongoing as required)
Drilling operations	3-27 February 2015 (including six standby days due to inclement weather)
Demobilisation	28 February 2015

Two environmental scientists from Aurecon provided site supervision, sample collection and processing. Seas Offshore was contracted to provide and manage the drilling component of the works and Fodico was subcontracted to provide and operate the vessel “Shackleton”.

The field team was directly supported by ALS Environmental (primary laboratory), Eurofins (secondary laboratory), James Cook University (macrobenthic analysis) and onshore Aurecon staff specialising in marine investigations, data management, Global Information Systems (GIS) and project management.

Additional sampling was undertaken within the investigation area by the Aurecon geotechnical team from 9 March to 4 May 2015 during the Project geotechnical investigations. Geotechnical sampling was undertaken to depths of 4.0m (generally at 1.0m intervals) to provide an indication of the naturally occurring metals.

2.3 Sample locations

The sampling locations provided in the SAP (refer Appendix A) were randomly selected using the methodology outlined in NAGD (2009). The actual sampling locations (with an accuracy of ±10m) are illustrated in Figure 2.1. Figure 2.2 displays the sampling locations in relation to the bathymetry of the area.

In accordance with the SAP, a total of 63 boreholes within the investigation area were assessed during the investigation. Twenty-four boreholes were located within the slope batter of the

investigation area. The remaining 39 boreholes were located within the channel floor of the investigation area.

Additional geochemical sampling was undertaken within the investigation area by the Aurecon geotechnical team during their concurrent investigations. A total of 53 samples were collected by the geotechnical team from 15 boreholes within the investigation area and were analysed for metals/metalloids.

2.4 Sample collection

A vibrocorer, operated by Seas Offshore aboard the vessel “Shackleton”, was used to collect the sediment cores at each location. A hand-held GPS device was used to position the vessel within 10m of each sample location, as proposed Section 3.2.2 of the SAP (refer Appendix A).

The approved SAP required sediment samples to be collected to comply with one of the following (refer Section 3.3.2 of Appendix A):

- Below the depth of dredging (-17.1m LAT); or
- Until vibrocore drilling refusal (due to encountering consolidated natural geological materials (e.g. rock, dense sands/gravels or stiff to very stiff clays)).

Core barrels were capped at each end following core retrieval and a vibrocore frame was used to ensure the barrel remained vertical. Photographs of the equipment used and the vessel are provided below.

Multiple cores were collected where additional volume of sediment was required for QA/QC purposes.

An Aurecon environmental scientist determined the suitably of each sediment core following collection, based on the following:

- No loss of surface sediments
- No major loss or disturbance of sediments at depth
- Target depth was achieved or refusal at rock, dense sands/gravels or stiff clay.

Where vibrocoring collected insufficient sediment, grab sampling was employed to collect surface sediment. In some cases, multiple grabs were collected to capture sufficient sediment for laboratory analysis.

Sediment samples were also collected at 15 additional locations within the investigation area, in conjunction with geotechnical investigation drilling using the Ocean Driller II jack-up barge. These samples were generally collected from 1.0m intervals (where practicable) to a depth of 4.0m and were used to supplement the geochemical investigation and provide an indication of the naturally occurring metals.

A summary of the number of samples collected during the investigation is provided in Table 2.2.

Table 2.2 Number of samples collected

Sample type	Number of primary samples	Number of QA/QC samples
Geochemical	157 (metals/metalloids) 98 (other parameters)	6 (field triplicate) 4 (inter-laboratory duplicate)
Particle size distribution	84	1 (field triplicate)
Dioxins	13 (investigation area) 22 (total)	-
Field pH	78	-
Suspension Peroxide Oxidation Combined Acidity and Sulfur (SPOCAS)	124	8

2.5 Sample processing

2.5.1 Sediment sampling

Sediment cores were cut into 1.0m lengths, split horizontally, photographed and logged prior to sampling. Each borehole log recorded the following information:

- Project name and number
- Name of sampler
- Date of sampling
- Type of sampler
- Sample location ID
- Easting and Northing of sample location
- Sediment colour, odour, texture (e.g. clay, silt, sand, gravel), plasticity and grain size
- Presence of organic matter, marine organisms, shells and anthropogenic material.

The sediment cores were split upon recovery and sub sampled along one split only (where sample quantity was sufficient). Following logging of each sediment core, grab samples were collected from each 0.5m section of the core in 150mL glass jars for volatile analysis. Grab samples of approximately 200g were also collected at 0.25m intervals along the length of the core and placed in plastic bags for ASS analysis.

The remainder of each 0.5m length of core were homogenised in a stainless steel mixing bowl. The following intervals were used for collection of the remaining sediment samples, including particle size distribution and the remaining geochemical analyses:

- 0.0m to 0.5m
- 0.5m to 1.0m or refusal (whichever occurred first)
- Every 0.5m length thereafter until the potential maximum depth or refusal (whichever occurred first).

During the geotechnical investigation, grab samples were collected from approximately 1.0m intervals along the core to a depth of 4.0m and placed in 250mL glass jars for metal/metalloid analysis.

2.6 Laboratory analysis

The primary analysis of sediment samples was conducted by ALS Environmental. Eurofins was selected as the secondary laboratory to analyse inter-laboratory duplicate samples. Both laboratories are NATA accredited for the analytical methods used.

Samples submitted to the primary laboratory were analysed for the contaminants listed in Table 2.3. Analyses conducted by the secondary laboratory are outlined in Table 2.4.

Table 2.3 Analyses conducted by the primary laboratory

Parameter	PQL	Sample suffix
Metals and metalloids (Al, Sb, As, Cd, Cr, Cu, Co, Fe, Pb, Mn, Ni, Se, Ag, V and Zn)	0.1-1mg/kg 0.01mg/kg (Hg) 10mg/kg (Mn)	A
Organotins	0.5-1µg/kg	A
TRH	3-5mg/kg	A, V
BTEX	200µg/kg	V
PAHs	4-5µg/kg	A

PAHs	1µg/kg
PCB	5µg/kg
OCP	1-5µg/kg
TOC	50mg/kg
Nitrogen (speciated)	0.1mg/kg
Phosphorus	5mg/kg

2.7 Quality assurance and quality control procedures

2.7.1 Laboratory procedures

The primary and secondary laboratories followed the laboratory QA/QC procedures outlined in Appendix F of NAGD, including analysis of laboratory blanks, laboratory controls, laboratory spiked samples and laboratory duplicates.

Validation of the laboratory QA/QC procedures is provided in Section 5.1 to determine the data quality to undertake an assessment of the geochemical characteristics of the material to be dredged.

Table 2.5 outlines the laboratory QA/QC procedures as required under NAGD (2009).

Table 2.5 Laboratory QA/QC procedure details

QA/QC procedure	Details
Laboratory blank	Laboratory blanks are submitted with each sample batch during analysis to determine the level (if any) of cross contamination that may occur during laboratory preparation, extraction and/or analysis. Analysis of the laboratory blanks should result in contaminant concentrations that do not exceed the LOR
Laboratory control	Laboratory controls are submitted with each sample batch and contain known concentrations of a contaminant. Analysis of the laboratory controls should result in contaminant concentrations that do not deviate from the known concentration to determine the accuracy of the laboratory analysis
Laboratory spike (surrogate and matrix)	A surrogate laboratory spike involves additions of a known concentration of compounds that are similar to those analysed, but are not likely to be present in the environment. The recovery of these compounds indicates the ability of the laboratory to extract the specified analyte. Surrogate spikes are generally performed on organic compounds A matrix laboratory spike is performed by splitting a sample and spiking it with a known contaminant concentration. The recovery of the contaminant is calculated and used to determine interference from the sediment upon the level of recovery
Laboratory duplicates	Laboratory duplicates use RPD of an intra-laboratory split sample material to analyse laboratory precision

2.7.2 Field procedures

2.7.2.1 Sample processing

All staff collecting sediment samples wore disposable nitrile, powder free gloves, which were replaced for each sample to ensure no cross-contamination between sampling locations and sample depths occurred.

All sediment samples were collected in pre-labelled plastic bags or solvent-washed and acid rinsed glass jars with Teflon lined lids as appropriate. Sample containers were labelled with a unique sample number on the waterproof label with indelible ink.

Sample containers for volatile analytes were filled with zero headspace to prevent volatilisation. Field triplicates and inter-laboratory duplicates were given labels that did not relate to the sampling location. Once collected and labelled, samples were immediately stored in an esky with ice bricks and transported to the laboratory within the specified holding times (generally within 24 hours).

All samples were submitted under chain of custody (CoC) documentation to ensure the analytical requirements of each sample are undertaken.

2.7.2.2 Decontamination procedure

At the beginning of each sampling day, the vessel was thoroughly inspected and washed down to prevent sample contamination. An area for sample processing was cleared of any potential sources of contamination (i.e. copper, brass or galvanised or oily surfaces).

Stainless steel equipment was used for sample collection and was cleaned before use and in between samples. Prior to obtaining each sample, all equipment, including core barrels, core trays and sampling equipment was cleaned as follows:

- Initial rinse with seawater
- Scrub with detergent solution (Decon 90)
- Rinse with seawater
- Final rinse with distilled water.

2.7.2.3 Additional field QA/QC

A trip blank container filled with clean chromatographic sand (as provided by the laboratory) was transported with the samples each day and analysed for volatile contaminants. Trip blanks were used to identify contaminants that may have contaminated the sediment samples during transport or storage.

A rinsate sample was collected once per day from a trowel used during sampling, as this was where the risk of cross-contamination between samples was most likely. Rinsate sample were analysed for the same contaminants as the sediment (i.e. those provided in Table 2.3). Rinsate results should be below the LOR to validate the decontamination procedure.

Field triplicates were collected at approximately 10% of sampling locations to determine the small-scale spatial variability of the chemical characteristics of the sediment. This was undertaken by collecting two cores in addition to the primary core from the field triplicate location (i.e. three separate and adjacent cores were drilled) and collecting a sample from each core at the same depths.

Inter-laboratory duplicates were collected at approximately 5% of sampling locations to identify variation associated with sub-sampled handling and analytical variation between laboratories. Inter-laboratory duplicates were collected from the same homogenised sediment as the primary sample, with one inter-laboratory duplicate analysed by the primary laboratory and the other inter-laboratory duplicate analysed by the secondary laboratory.

With the ASS sampling, approximately 6.5% of samples undergoing SPOCAS analysis were submitted with a blind duplicate sample to assess the variability and precision of both the sampling procedure and the analytical laboratory. The rate of duplicate ASS samples did not meet the recommended rate of 10% due to poor core recovery within the investigation area and the priority for geochemical sampling, however it is considered that this does not impact on the investigation findings or future management of ASS.

2.8 Data analysis

Contaminant concentrations were assessed against the guideline values outlined in Table 1.3 using the 95% upper confidence level of the mean (95% UCL), calculated with ProUCL Version 5.0 (US EPA 2013). Where no analytical values of a contaminant were reported over the NAGD PQL, statistical calculations were not undertaken. In some cases where less than three values were above LOR for the respective contaminant, the maximum recorded value was used instead of the 95% UCL for a conservative comparison against NAGD screening levels. Analytical values reported below the detection limit were set to one-half of the laboratory LOR as per NAGD (2009).

Concentrations of organic contaminants (except organotin) were adjusted to 1.0% total organic carbon (TOC) before being compared to relevant guideline values where the measured value was within the range of 0.2% to 10%. For TOC values outside of this range, the highest (10%) or lowest (0.2%) was adopted as appropriate. Organic contaminants with concentrations below detection limits were not normalised to 1.0% TOC but were included at half their LOR. For organotin, only one value was recorded over the laboratory PQL so this was not normalised or analysed.

Calculation of the 95% UCL assumes that the samples are statistically independent. As such, field triplicates and inter-laboratory duplicates were not included in the 95% UCL calculation. Where retesting of samples was undertaken, the highest reported value was utilised in the calculations.

2.9 Compliance with SAP and NAGD (2009)

Compliance of the Project geochemical investigation with the approved SAP and NAGD (2009) is demonstrated by:

- Drilling and sampling has been undertaken to full depth of sediment that has the potential to be contaminated. The vibrocorer achieved refusal in consolidated natural geological materials (i.e. rock, dense sands/gravels or stiff to very stiff clays).
- Physical testing of the consolidated natural geological materials (below depths where vibrocore refusal occurred) has occurred as part of the concurrent geotechnical investigation to determine particle size distribution (PSD) to input into hydrodynamic modelling and potential water quality impact assessment (i.e. turbidity movement and behaviours of the dredged material sediment).
- Sampling used a vibrocoring process, a NAGD recognised approved device for undertaking geochemical sampling. Grab sampling was undertaken where refusal occurred at the surface of the seabed and no sample was retrieved from the vibrocore barrel.
- Additional sediment sampling and laboratory analysis for metals and metalloids was undertaken in the underlying consolidated natural geological materials, in conjunction with the geotechnical investigation in 15 additional locations (above the 63 locations within the approved SAP) to collect information on metals and metalloids that have previously been demonstrated to be naturally occurring within Port Curtis.

NAGD (2009) refers to requirements for capital dredging, with samples being required from the full depth of contaminated, as well as potentially contaminated sediment (sediment contiguous with areas of known sediment contamination, or sediment in areas of known contamination input (e.g. inner harbours, berth pockets, and other locations affected by solid, liquid or airborne waste inputs)). NAGD (2009) goes on to state that "*Full depth is taken to mean at least the top 1 metre of sediment, and more if contamination could be found deeper. It is not normally necessary to sample (for chemical analysis) consolidated natural geological materials underlying these surface sediments, although physical testing of such consolidated materials would still be required to assess turbidity movement and behaviours of the dredged material, post-disposal*".

Potentially contaminated material (i.e. from anthropogenic activities) is considered to be the depth of material overlying natural geologic material (NAGD 2009).

A review of the previous sediment investigation works undertaken for GPC indicate that approximately the top 0.3m of sediment within Port Curtis is likely to be post 1950s, with this sediment band being the most likely (if any) to contain contaminants from anthropogenic inputs. This is in agreement with Vicente-Beckett et al. (2006) who demonstrated that anthropogenic influenced sediments are likely to only occur in the top 0.28m. Below this depth, contaminants will not be encountered and elevated levels of metals and metalloids, if detected, are likely to be naturally occurring and related to geology within the area.

The occurrence of naturally elevated levels of some metals and metalloids was demonstrated by Connell Hatch (2006), who reported elevated levels of silver at depths of >6m within the sediments tested offshore of Port Curtis. The Cooperative Research Centre (CRC) (Apte et al. 2005; Apte et al. 2006; Vicente-Beckett et al. 2006) also reported elevated levels of arsenic at depth and attributed the arsenic levels as being due to natural geology rather than anthropogenic in origin. Manganese is also prevalent in the Gladstone area with significant occurrences at the historic Mount Millar manganese mine and at Auckland Hill with manganese quarrying in the late 1800s.

During the Project geochemical investigation, drilling and sampling often reached refusal within the top 1m due to encountering consolidated natural geological materials (i.e. rock, dense sands/gravels or stiff to very stiff clays), which is expected within high energy environments such as the exposed outer channel. As such, it is considered likely that the looser sediments found elsewhere in Port Curtis (up to approximately 1.0m) are of a limited thickness within the Gatcombe and Golding Cutting bypass channels and in some areas, not present (depending on exposure). In addition, many of the upper sediments in the area to be dredged, which are potentially anthropogenically influenced at depths to 0.3m, may actually be part of older sediment deposits/geology.

The Clinton Bypass Channel Deepening Project encountered similar drilling and sediment conditions during implementation of the sediment sampling, with shallow refusal between approximately 0.3m and 1m depth due to the rocky seabed (Aurecon 2012).

A summary of the sampling locations (as drilled), drilling depths and relative levels (RL) based on existing bathymetry data, is provided in Table 2.6.

Table 2.6 Sampling locations

Sampling location	Easting	Northing	Dredging location	Drilling Depth (m)	RL existing seabed (m)	RL depth drilled to (m)
BH01	329653	7361351	Batter slope	0.56	-16.2	-16.7

No sediment was retrieved from BH29 due to the hard gravelly surface condition. This was confirmed during macrobenthic sampling, for which numerous grab samples were collected and only gravel and shell were retrieved.

In addition, four sampling locations, BH59 to BH62, were relocated as the bathymetry indicated a steep slope inaccessible by the vibrocorer. These sampling locations remained in their allocated grid squares, as produced in the SAP, but were moved away from the slope.

3 Results

3.1 General

Borehole logs for each of the sampling locations are presented in Appendix B and photographs of each of the cores collected are provided in Appendix C.

All laboratory results and laboratory QA/QC assessments are provided in Appendix D for the primary laboratory (ALS Environmental) and Appendix E for the secondary laboratory (Eurofins).

3.2 Geochemical

A statistical summary of the geochemical results, showing an assessment against relevant guideline values (identified in Section 1.5.3) is provided in Table 3.1 and Appendix F. Contaminant concentrations detected above the guideline values are highlighted in bold, along with the relevant assessment criteria.

The 95% UCL of all metals and metalloids for all horizon samples were below the NAGD (2009) screening levels (QLD Contaminated Land Guidelines for manganese). A small number of individual sample arsenic and nickel concentrations demonstrated values slightly above the NAGD screening levels; however, none of these exceedances were recorded at levels greater than their respective NAGD high levels (refer Table 1.3). While the deeper sediments did report a 95% UCL for manganese that was higher than the 500mg/kg EIL, these concentrations are likely to be naturally occurring and are in line with levels reported within the Port Curtis area in previous studies; Anastasi and Wilson (2010) examined Port Curtis as a case study in reviewing manganese in subtropical estuaries and stated that recorded naturally occurring manganese concentrations have been recorded in marine sediments with values up to 9,000mg/kg. The average abundance of manganese in Australian soils is 850mg/kg (AusIMM 2011).

Where NAGD (2009) screening levels are not available, a comparison against locally derived reference values and terrestrial background values has been undertaken.

Further discussion on the results is provided in Section 4.

Sampling locations where NAGD (2009) screening levels have been exceeded are illustrated in Figure 3.1.

Sampling and Analysis Plan Implementation Report (area to be dredged)

Figure 3.1: Metals reported above NAGD (2009) screening levels

3.3 Particle size distribution

This investigation undertook PSD sampling at 55 of the boreholes within the investigation area from varying depths with a total of 84 samples collected. The majority of the samples collected were in the top 1m of sediment.

The sediment samples varied in texture with 23 samples containing predominately fine material and 61 samples containing predominately coarse material. In addition, approximately 36% of samples collected within the top portion of the sediment were coarse in texture, with combined sand, gravel and cobble proportion of over 90%. This dropped to 15% in the deeper sediments, indicating more clays and silts at depth.

The sediment samples contained a greater proportion of gravels and cobbles within the investigation area nearest Facing Island. The southern extent of the investigation area contained a combination of sands, silts and clays (with very little gravel), with an increase in fine material at depth.

Figures 3.2 and 3.3 illustrate the PSD of sediments sampled and analysed during this investigation.

Table 3.2 summarises the PSD results, indicating that sand is the major component of the encountered sediment (45.5%), followed by gravel (20.0%). The geotechnical investigation will provide further detail on PSD for the material to be dredged at varying depths.

Table 3.2 Summary of PSD results

	Clay (<2 µm)	Silt (2-60µm)	Sand (0.062mm)	Gravel (>2mm)	Cobbles (>6cm)
Minimum	<1.0	<1.0	5.0	<1.0	<1.0
Mean	16.5	16.0	45.5	20.0	1.9
Maximum	54	53	97	71	48

A summary of the PSD laboratory results are included in Appendix G.

3.4 Acid sulfate soils

3.4.1 General

The full NATA certified laboratory report is provided in Appendix D while a summary of the results are provided in Appendix H.

The sections below discuss the ASS results and determine the likelihood of encountering actual acid sulfate soils (AASS) and potential acid sulfate soils (PASS) during dredging and dredged material placement.

The action criteria for ASS, as specified by Ahern et al. (1998) where more than 1,000 tonnes of sediment is to be disturbed, is as follows:

- Sulfur trail 0.03% S
- Acidity trail 18 mole H+/t.

3.4.2 Field testing

3.4.2.1 Screening criteria

For reasons of practicality and the avoidance of transporting and using oxidising chemicals on board the vessel, the pH tests were conducted by the primary laboratory. The primary laboratory utilised two different methods for obtaining pH measurements depending on if the pH tests were stand-alone or part of the SPOCAS suite. The same pH results are achieved, regardless of the method utilised.

A typical value that may indicate the presence of AASS includes:

Coordinate system: GDA_1994_MGA_Zone_56

Figure 3.3: Particle Size Distribution within deeper sediments (generally >0.5 m)

- A pH_F/pH_{KCL} value of 4 or less

Values that indicate the presence of PASS may include:

- A pH_{FOX}/pH_{OX} value of 4 or less

A ΔpH greater than 2 (from pH_F to pH_{FOX} and pH_{OX} to pH_{KCL})

- To a much lesser extent, a 'vigorous' observed reaction rate

3.4.2.2 Field and laboratory pH results

The pH test results provide an indication of the presence or absence of ASS in the sediment profile. The pH testing was conducted on each core, typically at 0.25m intervals along the core.

The pH tests were carried out on 210 sediment samples. These tests were used to indicate the likelihood of sediment being non-ASS, AASS or PASS. The results of the pH testing are summarised as follows:

- The pH_F/pH_{KCL} values for the majority of samples ranged from pH 4.5 to pH 9.7 indicating that AASS were generally not present in the sediments sampled within the investigation area. However, the potential for AASS was identified in sediment at the following locations:
  - BH43 0.25m: pH 3.0
  - BH56 0.25m: pH 3.0
- The results of the pH_{FOX}/pH_{OX} tests for all samples ranged from pH 2.0 to pH 10.5. The potential for the presence of PASS was identified at the following locations:
  - BH39 1.25m: pH 2.1
  - BH39 1.5m: pH 2.0
  - BH39 1.75m: pH 2.3
  - BH42 1.0m: pH 3.5
  - BH42 1.25m: pH 2.1
  - BH42 1.5m: pH 3.0
- A drop in two or more pH units is considered potentially indicative of PASS presence in the sediment. This was observed in 22.4% of samples with a reduction of greater than 6.0 pH units at the following locations:
  - BH39 1.25m
  - BH39 1.75m
  - BH42 1.25m.

Interpretation of the pH results generally indicated an absence of ASS across the majority of the sediment sampled within the investigation area. Selected samples from discrete locations and sediment horizons did however indicate AASS presence at BH43 and BH56 at depths of 0.25m and PASS presence at BH39 and BH42 at depths greater than 1.0m. Based on pH results. PASS may also be present in other locations within the investigation area, given the drop in pH upon oxidation in 22.4% of the samples.

3.4.3 SPOCAS results

The results for each component of the SPOCAS analysis methods are utilised as input into the acid base accounting, which is used to calculate the net acidity. These results are then used to estimate the volume of fine agricultural lime (fine aglime) recommended per tonne of sediment as treatment for the neutralisation of the sediment to be disturbed.

The acid base accounting takes into consideration the acid generating/neutralising capacity of the sediment in both its existing and disturbed states. It also includes consideration of potential for the sulfur material present in the sediment matrix to exchange with ions such as calcium and magnesium.

SPOCAS analysis was carried out on 132 sediment samples taken from within the investigation area.

3.4.3.1 Acidity trail

The acidity trail component of the SPOCAS analysis is comprised of the following analytical methods:

- Titratable actual acidity (TAA) 23F (mole H+/t)
- Titratable peroxide acidity (TPA) 23G (mole H+/t)
- Titratable sulfidic acidity (TSA) 23H (mole H+/t).

These analytical methods assist in quantifying the level of acidity present within the sediment.

TAA quantifies the amount of existing acid in the sediment as measured in mole H^+/t. The expression of existing acidity within the sediment is generally indicated by the measured pH. TAA was not detected (<2 mole H^+/t) in any of the samples, with the exception of BH39 at a depth of 1.5m, with a TAA value of 68 mole H^+/t. This result exceeded the action criteria of 18 mole H^+/t for TAA.

TPA quantifies the amount of acid that is likely to be generated in the sediment if oxidation were to occur (e.g. during or as a result of disturbance). TPA was not detected (<2 mole H^+/t) in the majority of samples, with the exception of BH39 (1.5m), BH43 (1.0m) and BH42 (1.5m). The maximum TPA value was 3,260 mole H^+/t at BH39 (1.5m).

TSA quantifies the amount of acid (existing or potential) within the sediment that is attributable to pyritic material, which indicates the presence/absence of ASS material. TSA was not detected (<2 moles H^+/t) in the majority of samples, except BH39 (1.5m), BH43 (1.0m) and BH42 (1.5m). The maximum value for TSA was 3,190 moles H^+/t at BH39 (1.5m).

3.4.3.2 Sulfur trail

The sulfur trail component of the SPOCAS analysis is comprised of the following analysis methods:

- Potassium chloride extractable sulfur (S_{KCl}) 23C (%S)
- Peroxide sulfur (S_P) 23D (%S)
- Peroxide oxidisable sulfur (S_{POS}) 23E (%S)
- Acidity – peroxide oxidisable sulfur (a-S_{POS}) a-23E (mole H+/t).

These analytical methods assist in quantifying the level of extractable sulfidic material present within the sediment, which includes soluble and adsorbed sulfate as well as sulfate from gypsum. These results are utilised as input into the acid base accounting for calculating the net acidity within the sediment attributable to the sulfur content available through oxidation.

S_{POS} was detected (>0.02% S) in 45% of the samples. The maximum value for S_{POS} was 5.12% S, detected in BH39 at a depth of 1.5m. Approximately 38% of the samples were above the action criteria (≥0.03% S) and were observed in boreholes throughout the investigation area.

3.4.3.3 Calcium values analysis

The calcium values analysis is comprised of the following analysis methods:

- KCl extractable calcium (Ca_{KCl}) method 23Vh (%Ca)
- Peroxide calcium (Ca_P) method 23Wh (%Ca)
- Acid reacted calcium (Ca_A) method 23X (%Ca).

These analysis methods assist in quantifying the level of extractable calcium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of calcium.

Ca_{KCl} results give an indication of the calcium that is soluble and exchangeable within the sediment. Ca_P results are utilised to calculate the reacted calcium (Ca_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable calcium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable calcium to calculate the acid reacted calcium. Results for Ca_{KCL} ranged from 0.05% Ca to a maximum of 0.33% Ca in BH39 (1.5m).

3.4.3.4 Magnesium values analysis

The magnesium values analysis is comprised of the following analysis methods:

- KCl extractable magnesium (Mg_{KCl}) method 23Sm (%Mg)
- Peroxide magnesium (Mg_P) method 23Tm (%Mg)
- Acid reacted magnesium (Mg_A) method 23U (%Mg).

These analysis methods assist in quantifying the level of extractable magnesium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of magnesium.

Mg_{KCl} results give an indication of the magnesium that is soluble and exchangeable within the sediment. Mg_P results are utilised to calculate the reacted magnesium (Mg_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable magnesium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable magnesium in order to calculate the acid reacted magnesium. Results for Mg_{KCL} ranged between not detected (<0.02% Mg) and 0.25% Mg in BH39 at a depth of 1.5m.

3.4.3.5 Excess acid neutralising capacity

All samples submitted to the laboratory for SPOCAS analysis were analysed for excess acid neutralising capacity (ANC_E). Results for ANC_E ranged from 0.2% $CaCO_3$ to 38.9% $CaCO_3$ in BH2 (0.0m), indicating that the sediment within the investigation area possesses acid neutralising capacity.

3.4.3.6 Acid base accounting

The acid base accounting analysis component of the SPOCAS analysis is comprised of the following calculations:

- Acid neutralising capacity (ANC) fineness factor (1.5)
- Net acidity (sulfur units) (%S)
- Net acidity (acidity units) (mole H+/t)
- Liming rate (kg $CaCO_3$/t).

The results of these calculations provide the information required for the development of sediment management measures for sediments throughout the investigation area.

Net acidity (sulfur units) results for samples analysed ranged from below the LOR (<0.02% S) to 5.23% S, where 97.7% of samples were below LOR for these analytes.

Net Acidity (acidity units) results for samples analysed ranged from below the LOR (<10 mole H^+/t) to 3,260 mole H^+/t where 97.7% of samples analysed were below LOR for these analytes.

Based on laboratory results for net acidity in sulfur units and acidity units, only three sediment samples, BH39 1.5m, BH42 1.0 and BH42 1.5m, were above the action criteria and exhibited values indicative of the presence of ASS, requiring management.

3.4.3.7 Liming rates

Table 3.3 outlines the treatment levels based on the sediment sample liming rates. These treatment rates are based on the Queensland Acid Sulfate Soil Technical Manual: Soil Management Guidelines

(Dear et al. 2014) and relate to the amount of sediment that will be disturbed during dredging and dredged material placement.

One sample at BH39 (1.5m) recorded a liming rate of 245kg $CaCO_3$/t, which requires an extra high level of treatment. The remaining two samples at BH42 (1.0 and 1.5m) recorded very high treatment levels.

Table 3.3 Treatment levels and volumes of $CaCO_3$/t

Treatment level	kg $CaCO_3$/t	Number of samples
Low	<1.0	0
Medium	1.0	0
High	>1.0-5.0	0
Very high	6.0-25	2
Extra high	>25	1

3.4.3.8 Summary

Table 3.4 summarises the reported net acidity exceedances and the corresponding calculated liming rates should these sediments be disturbed. Figure 3.4 illustrates the borehole locations in the investigation area where net acidity exceeded the action criteria of 18 moles H+/tonne.

Table 3.4 Soil analytical results exceeding net acidity action criteria

Sample location and depth	Net acidity (mol H+/tonne)	Liming rate (kg $CaCO_3$/t)
BH39 1.5m	3,260	245
BH42 1.0m	169	13
BH42 1.5m	196	15

A comparison between the net acidity and excess acid neutralising capacity of the sediment within the investigation area was undertaken to determine the ability of the sediments to self-neutralise. The level of excess acid neutralising capacity was substantially higher than the net acidity in the sediments throughout the investigation area, likely due to the presence of shell material. The overall excess acid neutralising capacity within the sediment in the investigation area, will neutralise acid that may be generated as a result of disturbance of sediment from dredging and dredged material placement. ASS management measures will be detailed in a separate ASS Management Plan.

Figure 3.4: Acid sulfate soils within the investigation area

4 Chemical analysis discussion

4.1 General

Extensive geotechnical and geochemical investigations have been previously undertaken within Port Curtis to support the various LNG projects, the Wiggins Island Coal Terminal Project, and Clinton Bypass Channel Deepening Project and the WBDDP. Comprehensive sampling programmes were undertaken for the WBDDP EIS (GHD 2009a), the Fisherman's Landing Northern Expansion Project EIS (GHD 2009b) and the QCLNG Project (GeoCoastal Australia 2009). However, only minor investigations have been undertaken within the outer harbour to date and as such, a comprehensive sampling programme was conducted for the investigation area.

Following investigations by Apte et al. (2005), Apte et al. (2006) undertook a study to determine the sources of the contaminants of concern. The report concluded that the elevated concentration of arsenic, chromium and nickel in Port Curtis sediments were identified as being derived from natural geology and not anthropogenic sources. Vicente-Beckett et al. (2006) also reported elevated levels of arsenic at depth and attributed the arsenic levels as being due to natural geology rather than anthropogenic in origin.

A review of the previous sediment investigation works undertaken for GPC indicate that approximately the top 0.3m of sediment within Port Curtis is likely to be post 1950s with this sediment band being the most likely (if any) to contain contaminants from anthropogenic inputs. This is in agreement with Vicente-Beckett et al. (2006) who demonstrated that anthropogenic influenced sediments are likely to only occur in the top 0.28m. Below this depth, elevated levels of metals, if detected, are likely to be naturally occurring and related to geology within the area.

The occurrence of naturally elevated levels of some metals was also demonstrated by Connell Hatch (2006), who reported elevated levels of silver at depths of >6m within the sediments tested offshore of Port Curtis.

The Project geochemical investigation demonstrated the presence of minor concentrations of naturally occurring and potential anthropogenic contaminants in individual samples across the investigation area. Individual concentrations that exceeded NAGD (2009) screening levels and/or the EPA Draft Guidelines for the Assessment and Management of Contaminated Land in QLD (1998) – EILs included arsenic, chromium, manganese and nickel concentrations. Individual samples also recorded concentration of total petroleum hydrocarbons (TPHs) and individual polycyclic aromatic hydrocarbons (PAHs) above the LOR but below the relevant guidelines and as such, these have not been discussed further.

4.2 Metals/metalloids

Chromium, copper, nickel, manganese and zinc were recorded above laboratory PQL in all the 157 samples collected (with arsenic being recorded in 152 of 157 samples). The elements were identified

in each depth horizon and as such, are ubiquitous across Port Curtis and likely to be naturally occurring.

The 95% UCL of all metals and metalloids for all horizon samples were below the NAGD (2009) screening levels. A small number of individual sample arsenic and nickel concentrations demonstrated values slightly above the NAGD screening levels; however, none of these exceedances were recorded at levels greater than their respective NAGD high levels (refer Table 1.3).

Metals with no NAGD screening level values (i.e. aluminium, iron, cobalt, manganese, selenium and vanadium) were compared against the locally derived reference values and terrestrial background values. While there were numerous exceedances over the PCIMP EH values, comparison to other background investigations in Port Curtis, such as Angel et al. (2012), GHD (2009a) and Anastasi and Wilson (2010), indicated that a number of metals are naturally elevated within Port Curtis, and the results from this investigation were comparable.

No discussion has been presented for antimony as no values were reported above the NAGD (2009) PQL.

Additional sampling at depth was undertaken for metals and metalloids during geotechnical works initiated after the geochemical sampling was completed. Two of these samples bridged the 0.95m to 1.05m depth horizon and for data analysis purposes these results (for boreholes GG02 and GG19) have been included within the <1.0m depth horizon.

4.2.1 Aluminium

Guideline values

No NAGD screening level values are available for aluminium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Aluminium was recorded above the PQL of 50mg/kg within all 157 samples collected, with a minimum concentration of 2,600mg/kg at BH14 (0.0m to 0.5m) and a maximum concentration of 21,800mg/kg within BH60 at a depth of 0.0m to 0.3m.

When results for aluminium are compared against the locally derived reference values, 25 of the 157 samples recorded concentrations were above the PCIMP EH value, although the 95% UCL for aluminium was 10,932mg/kg, below the PCIMP EH value of 15,000mg/kg.

Previous sediment investigations in Port Curtis recorded median aluminium concentrations of 8,770mg/kg (Angel et al. 2012) and 8,190mg/kg (GHD 2009a). The median aluminium concentration recorded during this investigation was 7,920mg/kg, which is similar to the previous results. In addition, the range of aluminium concentrations collected from the investigation area are all within the background range of the locally derived reference values.

4.2.2 Iron

Guideline values

No NAGD screening level values are available for iron and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Iron was reported above the PQL of 50mg/kg within all 157 samples collected, with a minimum concentration of 4,360mg/kg from BH8 (0.5m to 1.0m) and a maximum concentration of 40,700mg/kg from BH3 (0.0m to 0.3m).

When results for iron are compared against the locally derived reference values, 57 of the 157 samples recorded concentrations above the PCIMP EH value, although the 95% UCL for iron was 20,092mg/kg, just below the PCIMP EH value of 21,000mg/kg.

Previous sediment investigations in Port Curtis recorded median iron concentrations of 17,450mg/kg (Angel et al. 2012) and 20,900mg/kg (GHD 2009a). The median iron concentration recorded during this investigation was 17,000mg/kg, which is similar to the previous results. In addition, the range of iron concentrations collected from the investigation area are all within the background range of the locally derived reference values.

The distribution of iron in Port Curtis appears to be correlated to that of aluminium, with elevated concentrations of iron widespread across the investigation area and throughout the depth profile of the sediments.

4.2.3 Arsenic

Guideline values

Arsenic was recorded above the PQL of 1.0mg/kg within 152 of 157 samples collected, with five of the samples reporting levels above the NAGD (2009) screening level of 20mg/kg. No arsenic levels were recorded over the NAGD high level and the 95% UCL reported a value of 9.74mg/kg, which is well below the NAGD (2009) screening level. When separated into depth horizons of below 1.0m (<1.0m) and above 1.0m (>1.0m) depth, the sediments below 1.0m reported a greater 95% UCL of 10.55mg/kg when compared with 7.95mg/kg for sediments above 1.0m.

Arsenic has previously been demonstrated to occur naturally within Port Curtis at concentrations very close to ANZECC ISQG-low guidelines. Vicente-Beckett et al. (2006) illustrated via multivariate analyses that the concentrations of arsenic (as well as nickel and chromium) in the Port Curtis region are at natural background levels which are very close to the ANZECC ISQG-low guidelines.

The QCLNG Jetty Optimisation Study (GeoCoastal 2009) investigated sediment composition and concluded that there were at least two different depositional derivations of arsenic and determined that the source of all the arsenic bearing sediments is likely to be the residual and weathering products of the Wandilla parent formations on Curtis Island.

The distribution of metals in aquatic sediments has often been associated with the proportion of fines (mud fraction: <63 µm – silt plus clay), which has been previously explored in sediments in the Port Curtis area (Apte et al. 2005, 2006; Vicente-Beckett et al. 2006). Previous work undertaken for the WBDDP (Aurecon 2010) demonstrated a weak positive correlation with percentage clay in samples below 1.5m depth in the inner harbour channel suggesting that arsenic concentration may increase with clay proportion in the deeper sediments.

The widespread occurrence of arsenic in these sediments is consistent with the local geological formations surrounding Port Curtis. Arsenic is common in marine mudstones (Doonside and Wandilla Formations) where it substitutes for sulfur in the mineral pyrite, and in mineralised sequences surrounding granite intrusions (Mount Larcom area). The arsenic is often locked into framboidal pyrite structures where it remains immobilised until exposed to weathering. Examination of the arsenic exceedances in a stratigraphic context has found that a strong association exists between arsenic and distribution leading to accretion of transported sediments from weathered localised sources. These sources appear to be either sub-marine basement material underlying substrate highs, or a landward origin, such as an early reworking of adjacent surface soils.

Locally derived reference values

Given the 95% UCL for arsenic was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

4.2.4 Cadmium

Guideline values

Only five samples demonstrated levels of cadmium over the NAGD PQL with the highest of these reporting only 0.6mg/kg at BH8 (0.5m to 1.0m). This is well below the NAGD (2009) screening level of 1.5mg/kg and NAGD high level of 10mg/kg.

Locally derived reference values

Given cadmium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.5 Chromium

Guideline values

Chromium was recorded above the NAGD PQL in all 157 samples. Only one sample taken at a 1.95-2.05m depth at GG12 reported a value above the above the NAGD screening level of 80mg/kg, with a concentration of 119mg/kg, which is well below the NAGD high level value of 370mg/kg. The 95% UCL of 17.53mg/kg was significantly lower than the NAGD screening level. The one exceedance was recorded in sediments deeper than 1.0m, indicating that the source is likely to be natural in origin.

Locally derived reference values

Given chromium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.6 Copper

Guideline values

While copper was recorded above the NAGD PQL in all 157 samples, no samples exceeded the NAGD screening level (65mg/kg) with a maximum concentration recorded of 53mg/kg taken from a depth of 0.5m to 1.0m from BH12. The 95% UCL of 20.67mg/kg was also significantly below the NAGD screening level.

Locally derived reference values

Given the 95% UCL for copper was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

4.2.7 Cobalt

Guideline values

No NAGD screening level values are available for cobalt and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Cobalt was recorded above the PQL of 0.5mg/kg within all 157 samples collected, with a minimum concentration of 2.2mg/kg from GG10 at a depth of 0.9-1.0m and a maximum concentration of 84.3mg/kg at GG17 (0.9m to 1.0m).

When results for cobalt are compared against the locally derived reference values, 97 of the 157 samples collected recorded concentrations above the PCIMP EH value, with the 95% UCL for cobalt (14.1mg/kg) above the PCIMP EH value of 6.9mg/kg.

During the WBDDP investigations, cobalt was detected at concentrations up to 77.4mg/kg with a median concentration of 11.5mg/kg (GHD 2009a). Cobalt concentrations detected within the investigation area generally fall within the range of these WBDDP results and have a similar median of 7.9mg/kg.

Terrestrial background values

The cobalt concentrations are also within the terrestrial background values, which range from 2mg/kg to 170mg/kg (EPA 1998) and the median concentration is equal to the average abundance of cobalt in soil (8.0mg/kg), as determined by AusIMM (2011).

4.2.8 Lead

Guideline values

Lead was identified above the NAGD PQL in 155 of 157 samples. No concentrations of lead were recorded above the NAGD screening level of 50mg/kg. The maximum concentration was 25.3mg/kg, which was recorded at a depth of approximately 4.0m at borehole GG18, well below the depth likely to be anthropogenically influenced.

Locally derived reference values

Given lead was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.9 Manganese

Guideline values

No NAGD screening level values are available for manganese and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

The presence of manganese within Port Curtis appears to be ubiquitous both spatially and with depth, with manganese being recorded within all 157 samples collected. Boreholes containing elevate manganese are presented in Figure 4.1.

When the manganese results are split between approximately <1.0m and >1.0m depth, it is evident that the highest manganese concentrations are found at depth with the following 95% UCLs:

- Manganese (<1.0 depth): 494.3mg/kg (from 110 samples)
- Manganese (>1.0 depth): 823.2mg/kg (from 47 samples)
- Manganese (combined depths): 469.8mg/kg (from 157 samples).

The results for the sediments >1.0m depth reported a maximum manganese concentration of 4,420mg/kg. Subsequent reanalysis of this sample reported concentrations of 2,293, 3,000 and 3,635mg/kg and a subsequent median concentration of 3,318mg/kg. The 95% UCL for depths of >1.0m when calculated with this median value was 778mg/kg.

The borehole locations containing elevated manganese with respect to depth are illustrated in Figure 4.2.

Angel et al. (2010) investigated dissolved metal levels in Port Curtis, including manganese and concluded that nickel and manganese are likely to be released by natural processes such as reduction of manganese (hydr)oxides and leaching by the lower sediment and water pH. Anastasi and Wilson (2010) also examined Port Curtis as a case study in reviewing manganese in subtropical estuaries and stated that recorded naturally occurring manganese concentrations have been recorded in marine sediments with values up to 9,000mg/kg.

Previous sediment investigations in Port Curtis recorded median manganese concentrations of 382.5mg/kg (Angel et al. 2012) and 298mg/kg (GHD 2009a). In addition, concentrations of manganese in the sediments of Port Curtis derived by Angel et al. (2012) and during the WBDDP (GHD 2009) were recorded up to 1,330mg/kg and 7,680mg/kg, respectively.

The median manganese concentration recorded during this investigation was 271mg/kg, and a maximum of 4,420mg/kg, which are within the range of concentrations identified by previous

Figure 4.2: Boreholes containing elevated manganese concentrations compared with depth

investigations. This indicates that manganese concentrations from the investigation area are consistent with the locally derived reference values.

The 95% UCL for manganese for the investigation area of 469.8mg/kg, is also consistent with background concentrations identified in previous investigations within Port Curtis.

Manganese is the twelfth most abundant element in the Earth's crust with among 300 minerals containing manganese and the two main manganese minerals being pyrolusite (MnO_2) and rhodochrosite ($MnCO_3$). It is an essential element and is required by mammals and birds for normal growth. High concentrations of manganese may occur under anoxic (absence of oxygen) conditions such as the bottom of deep reservoirs or lakes, or in groundwater.

Manganese has been recorded as occurring within Port Curtis as early as 1606 when the Portuguese explorer Pedro Fernández de Quirós allegedly described the Port Curtis strandline as being strewn with “black heavy pebbles”. Cardinal Moran, in his book ‘Discovery of Australia by de Quiros in the Year 1606’, went on further to clarify that locally these were referred to in the Port Curtis area as “manganese bubbles” (Aurecon 2010).

There are six separate areas of manganese mineralisation located within the Gladstone area with the most significant of which being the historic Mount Millar manganese mine which opened in 1895 and operated intermittently until 1916 and then from 1958 to 1960. Exploration permits are currently active within the Gladstone area (Genesis Resources Ltd 2010) examining the viability of several northwest striking manganese ore deposits within the Doonside Formation approximately 15km west of Gladstone. The deposits occur as structurally controlled lenses parallel to bedding in the enclosing sediments.

Manganese was historically mined from 1882 to 1900 at Auckland Hill, adjacent to Port Curtis (GPC 2012). The rocky face of Auckland Hill is a remnant of this manganese mining and quarrying.

Terrestrial background values

Manganese is not specified within NAGD (2009) but is included within the EPA Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (1998). As such, the manganese EIL of 500mg/kg has been utilised in order to report the levels contained within the investigation area sediments. Of the 157 samples collected, 37 samples at 24 locations reported levels over the 500mg/kg EIL (refer Figure 4.1).

In addition, the EPA Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (1998) detail background levels for manganese in soils ranging from 4mg/kg to 12,600mg/kg, indicating a large abundance and variation of manganese in Queensland soils. All samples collected have manganese concentrations within this range.

While the deeper sediments did report a 95% UCL higher than the 500mg/kg EIL, these are likely to be naturally occurring and in line with levels previously reported within the Port Curtis area in previous studies.

The AusIMM (2011), *Field Geologist’s Manual,* Fifth Edition, provides background ranges for various metals and metalloids in Australia, with an average abundance of 850mg/kg for manganese observed in Australian soils. The 95% UCL for manganese (regardless of depth) was below this background value for soils.

4.2.10 Nickel

Guideline values

Nickel was recorded over the NAGD PQL for all the 157 samples collected. Nine samples were reported at or above the NAGD screening level of 21mg/kg with the highest concentration being 26.9mg/kg from GG17 at a depth of 0.9m to 1.0m. The 95% UCL for all samples was 11.98mg/kg which is well below the NAGD screening level.

Locally derived reference values

Given the 95% UCL for nickel was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

As discussed previously, Angel et al. (2010) investigated dissolved metal levels in Port Curtis and concluded that nickel and manganese are likely to be released by natural processes such as reduction of manganese (hydr)oxides and leaching by the lower sediment and water pH. This is evident in this investigation as nickel was identified in all samples and at all depths.

4.2.11 Selenium

Guideline values

Given there are no NAGD (2009) screening level values available for selenium, a comparison against locally derived reference values was conducted.

Locally derived reference values

Selenium was recorded above the PQL of 0.1mg/kg within 156 of the 157 samples collected. The minimum concentration of <0.1mg/kg was from GG17 at a depth of 3.9m to 4.0m while the maximum concentration of 5.2mg/kg was from BH63 at a depth of 0.0m to 0.4m.

When results for selenium are compared against the locally derived reference values, 38 of the 157 samples recorded concentrations above the PCIMP EH value, with the 95% UCL for selenium (1.246mg/kg) only slightly above the PCIMP EH value of 1.0mg/kg.

During the WBDDP investigation, selenium was detected at concentrations up to 5.4mg/kg with a median concentration of 0.4mg/kg (GHD 2009a). Selenium concentrations recorded within the investigation area are generally consistent with the results from the WBDDP with a median of 0.6mg/kg. The 95% UCL for selenium (1.246mg/kg) is within the background range as recorded during the WBDDP.

4.2.12 Silver

Guideline values

Silver was recorded above the NAGD PQL at 29 of 157 samples. However, no samples were recorded above the NAGD screening level of 1.0mg/kg and the maximum concentration detected was 0.6mg/kg from BH12 at a depth of 0.5m to 1.0m. It should be noted that six of the samples reported values of <0.5mg/kg as opposed to 0.1mg/kg, as specified in the NAGD PQL. The adjustment for calculating the 95% UCL, where the recorded value below the LOR is adjusted to half of the LOR, has therefore resulted in a more conservative figure being used in the calculations.

Locally derived reference values

Given silver was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.13 Vanadium

Guideline values

Given there are no NAGD (2009) screening level values available for vanadium, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Vanadium was recorded above the PQL of 2.0mg/kg within all 157 samples collected, with a minimum concentration of 12.4mg/kg from GG02 at a depth of 1.9m to 2.0m and a maximum concentration of 120mg/kg from BH43 at a depth of 0.0m to 0.5m.

When results for vanadium are compared against the locally derived reference values, 72 of the 157 samples recorded concentrations above the PCIMP EH value and the 95% UCL for vanadium was 46.0mg/kg, which is slightly above the PCIMP EH value (40mg/kg).

An investigation by Angel et al. (2012) identified vanadium concentrations in sediments of Port Curtis ranging from 11mg/kg to 114mg/kg (median of 40.5mg/kg) while vanadium concentrations in sediments ranged from 5.6 mg/kg to 287mg/kg (median of 45.3mg/kg) during the WBDDP investigation (GHD 2009a). The vanadium concentrations identified within the investigation area had a very similar range with a median concentration of 36.5mg/kg, similar to the locally derived reference values.

Terrestrial background values

In addition, AusIMM (2011) provides an average abundance value of 100mg/kg for vanadium as observed in Australian soils. The 95% UCL for vanadium (46.02mg/kg) is well below this value.

4.2.14 Zinc

Guideline values

Zinc was recorded above the NAGD PQL in all of the 157 samples collected. However, no exceedances were recorded over the NAGD screening level value of 200mg/kg with the highest concentration recorded being 84.5mg/kg from GG14 at a depth of 1.85m to 1.95m.

Locally derived reference values

Given zinc was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.15 Mercury

Guideline values

Mercury was recorded in 58 of the 157 samples at levels over the NAGD PQL. However, no exceedances were recorded over the NAGD screening level of 0.15mg/kg with the maximum concentration being 0.1mg/kg, recorded at a depth of 2.9m to 3.0m from borehole GG14.

Locally derived reference values

Given mercury was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.3 Organics and BTEX

No polychlorinated biphenyl (PCB), organochlorine pesticide (OCP) and organophosphorus pesticide (OPP) concentrations were detected with all samples tested reporting concentrations below the laboratory LORs (and hence below guideline levels).

A small number of samples (19 samples from 97 samples) recorded TPH concentrations over the LOR of 3.0mg/kg with the highest value recorded being 17mg/kg from BH42 at a depth of 1.0m to 1.6m. When adjusted to 1.0% TOC, the 95% UCL is 189.9mg/kg, below the NAGD screening level of 550mg/kg. There were no benzene, toluene, ethylbenzene and xylene (BTEX) detections within any of the samples analysed.

In relation to total recoverable hydrocarbons (TRHs), 44 samples (of 96 collected) reported concentrations above the laboratory LOR with the maximum concentration of 19mg/kg (from BH42 at 1.0m to 1.6m) with a 95% UCL of 6.64mg/kg which is significantly lower than the NAGD screening level of 550mg/kg. When the data is normalised to 1.0% TOC, the 95% UCL (315.3mg/kg) remains significantly below the NAGD screening level.

Sixteen of 96 samples reported PAHs (including 11 different PAHs) above the laboratory LORs. These 16 samples were restricted to five individual borehole locations (BH21 (0.0m to 0.5m); BH42 (0.5m to

1.0m) and (1.0m to 1.6m); BH49 (0.0m to 0.5m); BH55 (0.5m to 0.9m) and BH58 (0.0m to 0.5m)). The sum of the PAHs was low with the maximum sum of PAHs was 46µg/kg from BH21 at a depth of 0.0m to 0.6m. When the data is normalised to 1.0% TOC, the maximum value (2,300µg/kg) and the 95% UCL (199µg/kg) are significantly below the NAGD screening level of 10,000µg/kg.

4.4 Organotins

Only one sample for tributyltin from the 96 samples collected reported a concentration above the NAGD PQL of 1.0mg/kg. This single sample was reported in borehole BH33 from a depth of 1.0m to 1.5m with a concentration of 5.2µg Sn/kg, which is well below the NAGD screening level of 9.0µg Sn/kg.

4.5 Nutrients and total organic carbon

No guideline values exist for TOC and nutrients in sediments within NAGD (2009) although the PCIMP has set EH values derived from the 95th percentile of background data collected previously during the PCIMP monitoring with WCS values being set at 10 times the PCIMP EH values (PCIMP 2011). The PCIMP EH and WCS for ammonia as N are 15mg/kg and 150mg/kg, respectively.

Simpson et al. (2013) (unpublished) provides revised sediment quality values, with a proposed screening level of 4.0mg/kg for ammonia.

For ammonia as N, 95 of 97 samples had concentrations recorded above the NAGD PQL of 0.1mg/kg with 15 samples recording concentrations over the Simpson et al. (2013) screening level of 4.0mg/kg with the maximum concentration recorded being 7.3mg/kg from BH42 at a 1.0m to 1.6m depth. The other 14 exceedances of the screening level were all located within the top 1.0m of sediment.

There were no ammonia as N concentrations recorded in the investigation area in exceedance of the PCIMP EH value and the 95% UCL of 2.5mg/kg was significantly below the PCIMP EH value and the Simpson et al. (2013) screening level.

Ammonia as N concentrations within the sediments were generally greater at locations with higher TOC and silt/clay content, compared with locations characterised by coarser material. The 95% UCLs for TOC and total ammonia as N were 0.28% and 2.5mg/kg, respectively, reflecting the relatively low clay content of most of the sampled locations.

4.6 Dioxins

Guideline values

NAGD (2009) does not provide screening levels for dioxins.

Minimal sampling for dioxins levels has been undertaken previously within Port Curtis, with virtually no samples undertaken within the shipping channels. As such, during this investigation, 22 samples were taken throughout Port Curtis with 13 samples undertaken within the investigation area (refer Figure 4.3). The remaining samples were collected from the potential DMPAs, including East Banks Expansion DMPA, West Banks Island DMPA and Port Central Expansion DMPA.

Results are discussed for all of the samples undertaken, as there was no significant difference between results when analysed for the 13 samples as opposed to the full 22 samples. As a result, the full 22 dioxin samples were utilised to strengthen the analysis.

The summary dioxin results from this investigation are:

- Median: 0.355pg TEQ/g
- Maximum: 2.89pg TEQ/g
- Minimum: 0.04pg TEQ/g.

Figure 4.3: Dioxin concentrations within the investigation area

Canadian sediment quality guidelines provide for dioxins in marine environments by adopting the freshwater ISQGs and probably effect levels (PELs). This is due to a paucity of data for the marine environment (Canadian Council of Ministers of the Environment (CCME) 1999). As a result, any comparison against these levels should be considered indicative only.

The Canadian ISQGs represent the concentration below which adverse biological effects are expected to rarely occur while PELs are the concentration above which adverse effects are expected to frequently occur. The Canadian ISQG value for dioxins is 0.85pg TEQ/g while the PEL is 21.5pg TEQ/g (CCME 1999).

All dioxin concentrations recorded during the investigation are significantly below the PEL, while the median concentration is below the ISQG, indicating that dioxins within the sediments of Port Curtis are unlikely to result in adverse biological effects.

As dredged material will be placed in a reclamation area for this Project, it is considered more appropriate to compare the results to the Dutch Intervention Levels for dioxins (1,000pg/g) (Ministry of Housing, Spatial Planning and the Environment 2000). As the median concentration (and maximum) are several orders of magnitude below the Dutch Intervention Level, and no risk is likely to future site users of the reclamation area.

Locally derived reference values

The National Dioxins Program (Müller et al. 2004) has investigated the levels of dioxins around Australia by reporting the concentrations of dioxins and dioxin-like chemicals. Dioxins often occur as complex mixtures and exert their toxicity by the same mechanism, the concept of toxic equivalents. This concept allows the concentration or mass of each dioxin in a complex mix to be connected to an equivalent mass of the most toxic dioxin – 2,3,7,8 tetrachlorodibenzo-p-dioxin (TCDD) by using a set of toxic equivalency factors (TEFs) which rate the toxicity of the various dioxins against TCDD. The equivalent TCDD concentrations are then summed (∑) to estimate the concentration of mixture of dioxins as a TCDD equivalent concentration (called ∑TEQ).

EHP undertook dioxin sampling across 31 sites within Port Curtis and related waterways in early 2012 whilst investigating the sediment quality of Port Curtis and its tributaries. Many dioxins were detected and these detection values were compared with dioxin concentrations from the National Dioxins Program using toxic equivalence values (∑TEQ). The ∑TEQ values were found to be typical of those recorded throughout Australia for aquatic sediments adjacent to urban/industrial environments and the values were considered typical of estuaries in Australia.

In order to place this investigation in context and compare with the Müller et al. (2004) study and the EHP (2012) Port Curtis results, the WHO-TEF calculated using zero for not detected dioxins was utilised. As noted within EHP (2012) Port Curtis report, an exact comparison cannot be made as the WHO has made some minor changes since the National Dioxins Program. A comparison of dioxins ∑TEQ values using the same TEFs cannot be made as the raw data from the National Dioxins Program are not available.

The Port Curtis study (EHP 2012) adapted two Müller et al. (2004) box plot figures and compared these against their own results. Müller et al. (2004) provides an explanation for interpretation of the box plots. When dioxin results from the Project geochemical investigation are compared with both of these previous studies (refer Figure 4.4), it can be seen that the results for this study for the sum of dioxin equivalent on a dry weight basis (reported as WHO-TEQ_{zero}) fall between the concentrations shown for agriculture and urban/industrial sediments and appear different from the results reported from the Port Curtis investigation (EHP 2012).

When the sum of dioxin and furan concentrations on a dry weight basis are compared against group totals sediments from freshwater, estuarine and marine environments and the previous Port Curtis study (refer Figure 4.5), the results fall between the estuarine and marine sediments and appear to be more similar to the marine values. This is in contrast to the previous Port Curtis study (EHP 2012), which appeared more similar to the estuarine sediments in terms of group total dioxin levels. This is likely due to the exposed outer harbour channel sediments of this investigation being more consistent with open marine sediments as opposed to the previous Port Curtis study, which included many of the upper tributaries and sheltered waters of Port Curtis with very few samples within the deeper exposed outer harbour channels.

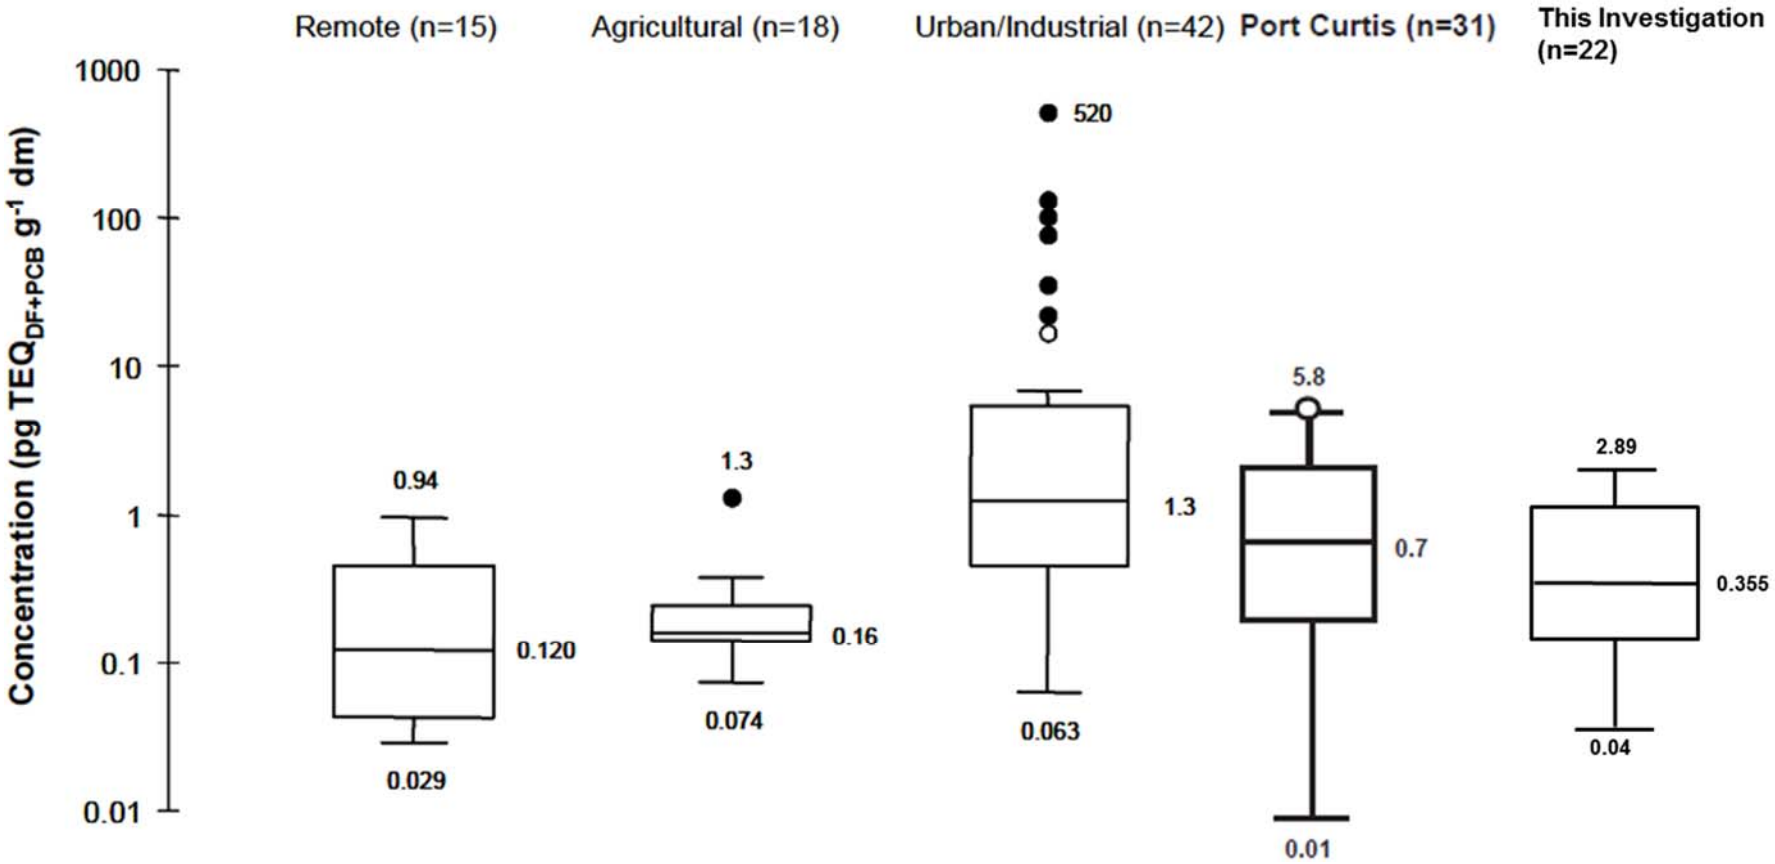

Figure 4.4 Box plot figures showing WHO-TEF values (calculated using zero for not detected dioxins)

Figure note: The first three box plots (remote, agriculture and urban/industrial) are adapted from the National Dioxins Program (Müller et al. 2004). The box plot labelled Port Curtis is taken from the EHP (2012) Port Curtis Study and the final boxplot illustrates the dioxin results across Port Curtis reported during this investigation. For interpretation of the box plots, refer to the National Dioxins Program (Müller et al. 2004).

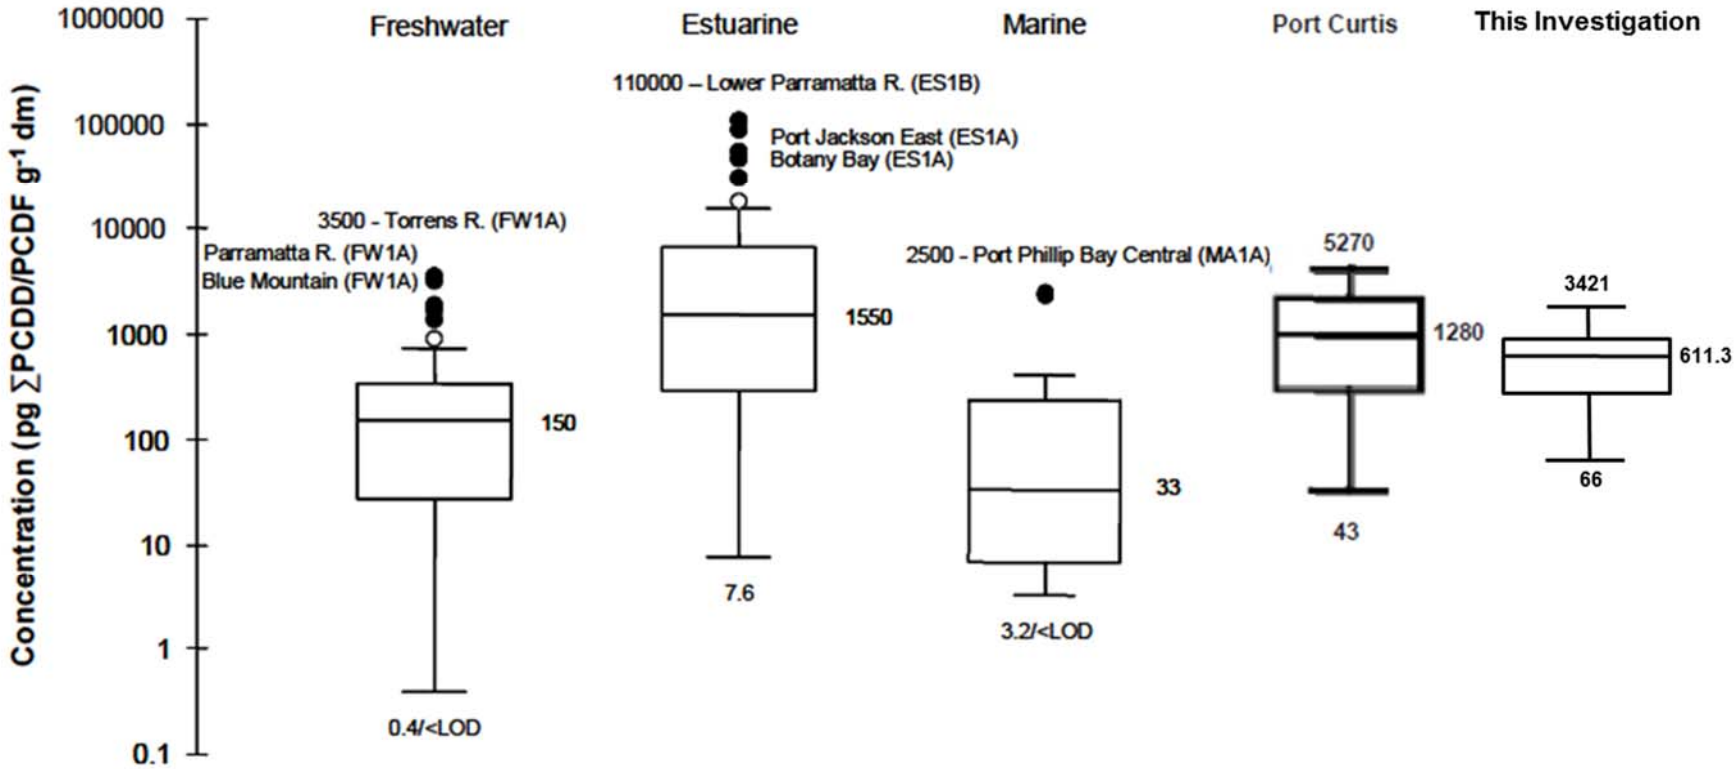

Figure 4.5 Box plot figures showing dioxin Group Total Concentrations pg/g

Figure note: The first three box plots (freshwater, estuarine and marine) are adapted from the National Dioxins Program (Müller et al. 2004). The box plot labelled Port Curtis is taken from the EHP (2012) Port Curtis Study and the final boxplot illustrates the dioxin results across Port Curtis reported during this investigation. For interpretation of the box plots, refer to the National Dioxins Program (Müller et al. 2004).

5 Data validation

5.1 Laboratory QA/QC

5.1.1 General

Details of the primary and secondary laboratory QA/QC are provided in Appendices D and E. A description of the laboratory QA/QC procedures implemented is provided in Section 2.7.

5.1.2 Sample conditions

All samples were received by the laboratories in appropriate sample containers that were pre-treated and preserved. Samples were stored in a chilled esky with ice bricks whilst in the field and were frozen upon receipt by the laboratory. All samples were delivered to the laboratories within the recommended holding times.

All samples were analysed within the recommended holding times, with the exception of the following:

- Trip Blank 17 8 days overdue
- Rinsate 8 (Nitrate as N) 4 days overdue
- Rinsate 10 (Nitrate as N) 3 days overdue
- Rinsate 11 (Nitrate as N) 1 day overdue
- Rinsate 17 (Nitrate as N) 4 days overdue
- Rinsate 18 (Nitrate as N) 3 days overdue.

Given the majority of samples were analysed within the recommended holding times and the above exceptions are for QA/QC purposes only, it is considered that these samples conditions are acceptable.

5.1.3 Laboratory blanks

The assessment of the laboratory blank samples reported by ALS Environmental and Eurofins reported concentrations of all parameters below the LOR, indicating that the samples were not contaminated during laboratory analysis.

5.1.4 Laboratory duplicates

The assessment of laboratory duplicates is considered generally acceptable, although some exceedances of the NAGD recommended RPD of ±35% were recorded. These exceedances were recorded in the following samples/analytes:

- BH12 0.0-0.5A:
  - Cobalt
  - Zinc
  - Manganese
- Anonymous sample (17 February 2015):
  - Chromium
- BH13 0.5-1.0A:
  - Total Phosphorus as P
- BH40 1.0-1.2A:
  - Aluminium.

The remaining laboratory duplicates are compliant with the RPD criteria. Given the large volume of samples analysed and that only six samples/analytes exceeded the RPD criteria, it is considered that the level of precision for the geochemical data is acceptable.

5.1.5 Surrogate and matrix spikes

The laboratory control spikes were within the recovery limits for all analytes, with the exception of organotins in a few samples, which were only slightly above the recommended limit and were considered to be within range of the laboratory's data quality objectives.

The percent recovery of matrix spikes for ammonia was not reported for some samples due to primary dilution requirements and the high ammonia concentrations in the samples. Matrix spike recovery for organotins (mainly, monobutyltin) was less than the NAGD criteria. However, this is not considered to be an issue given organotin concentrations were below the LOR in the actual samples. Matrix spike recovery for phosphorus was also slightly above the recovery limit in some instances.

Given these variations from the NAGD criteria were minor and the samples were below NAGD screening levels, it is considered the surrogate and matrix spikes from the analysis are acceptable.

5.2 Field QA/QC

5.2.1 Trip blanks

Trip blank samples were utilised at a rate of one sample per day. The majority of trip blank results reported no concentrations above the LOR indicating negligible QA issues are evident in relation to the storage and transport of samples.

A single trip blank recorded a contaminant concentration for TRH slightly above the LOR. However, given that detected concentrations were significantly below the NAGD screening level, this result is considered negligible. QA/QC summary tables are provided in Appendix F.

5.2.2 Rinsates

Rinsate samples were collected at a rate of one sample per day from the sampling equipment after undergoing a standard decontamination. The majority of rinsate samples report no concentrations above the LOR indicating negligible QA issues are evident in relation to the decontamination process. QA/QC summary tables are provided in Appendix F.

However, some rinsates recorded a single contaminant concentration slightly above the LOR. These included:

- Monobutyltin:
  - Rinsate 2
- Manganese:
  - Rinsate 17
- Cadmium:
  - Rinsate 18
- Ammonia
  - Rinsate 7
  - Rinsate 8
  - Rinsate 10
  - Rinsate 11.

It should be noted that five of the rinsate samples were analysed between one and four days beyond the recommended holding times, due to laboratory delays.

The detected concentrations in the rinsate were below the PQLs for these contaminants in sediment and for each rinsate, only a single contaminant exceeded the LOR. Therefore, these exceedances are considered negligible and as such, the rinsate results indicate an acceptable level of decontamination.

5.2.3 Field triplicates

Field triplicates were collected to determine the spatial variability in the physical and chemical characteristics of the sediments. The RSD was calculated for each contaminant. NAGD (2009) recommends the RSD of field triplicates should fall within ±50%.

A total of six field triplicates were sampled during the Project geochemical investigation within the investigation area. RSDs were calculated and reported within this threshold, with the exception of the samples presented in Table 5.1. QA/QC summary tables are provided in Appendix F.

Table 5.1 Field triplicates exceeding the recommended RSD

Analyte	Primary sample	Triplicate A	Triplicate B	RSD (%)
BH9 0.0-0.45m A				
Arsenic	6.15	16.4	5.88	63.3
Total phosphorus as P	467	250	162	53.6
Ammonia as N	3.6	1.2	1.2	69.3
BH25 0.0-0.5m A				
Total Kjeldahl Nitrogen as N	30	30	130	91.2
Total Nitrogen as N	30	30	130	91.2
Ammonia as N	0.3	0.4	1.5	90.8
BH37 0.0-0.3m A				
Manganese	533	346	176	50.8
BH38 0.0-0.5m				
Selenium	0.4	0.2	0.6	50.0
BH44 0.0-0.5m A				
Copper	35.4	35	10	54.3
Nickel	25	17.9	8	50.3
Mercury	0.03	0.01	<0.01	70.7

Analyte	Primary sample	Triplicate A	Triplicate B	RSD (%)
BH54 0.0-0.5m A				
Arsenic	8.91	26.5	12.8	57.5
Copper	16.9	6.7	5.4	65.2
Total Organic Carbon	0.11	0.29	0.6	74.4

A total of 14 field triplicate results exceeded the recommended target RSD. However, given these exceedances are likely due to the variation in particle and grain sizes of the sediments, it is considered that there was adequate precision from sample collection, handling and the primary laboratory analytical techniques.

5.2.4 Inter-laboratory duplicates

Inter-laboratory duplicates were collected to assess variation between the laboratories. The primary laboratory (ALS Environmental) analysed the Duplicate A samples while the secondary laboratory (Eurofins) analysed the Duplicate B samples.

The RSD was calculated for each contaminant. NAGD (2009) recommends the RSD of inter-laboratory duplicates should fall within ± 50%. Relative percent deviation (RPD) was calculated where the secondary laboratory had a larger LOR than the primary sample or in the instances where a contaminant was not analysed by the secondary laboratory.

A total of three inter-laboratory duplicates were sampled during the Project geochemical investigation within the investigation area. RSDs were calculated and reported within this threshold with the exception of the samples presented in Table 5.2. QA/QC summary tables are provided in Appendix F.

Table 5.2 Inter-laboratory duplicates exceeding the recommended RSD

Analyte	Primary sample	Duplicate A	Duplicate B	RSD/RPD (%)
BH20 0.0-0.4m A				
Total Nitrogen as N	90	140	36	59
Ammonia as N	0.9	2.4	9.3	106.7
Total Organic Carbon	0.07	0.15	-	73
BH49 0.0-0.5m A				
Arsenic	7.97	6.83	22	68.9
Chromium	22.1	22.1	67	69.9
Manganese	179	228	680	76.2
Zinc	36.4	40.9	110	66.1
Nitrate as N	<0.1	<0.1	0.4	86.6
Total Phosphorus as P	328	352	890	60.7
Total Organic Carbon	0.11	0.22	-	66.7
Benzo(g.h.i)perylene	6	<4	<1	68.6
Sum of PAHs	19	<4	<1	120.5

Analyte	Primary sample	Duplicate A	Duplicate B	RSD/RPD (%)
BH62 0.0-0.3m A				
Total Kjeldahl Nitrogen as N	190	170	23	71.4
Total Nitrogen as N	190	170	24	70.8
Ammonia as N	1.4	1.5	4.7	74.1

A total of 15 inter-laboratory duplicate results exceeded the recommended target RSD and RPD. However, given these exceedances are likely due to the variation in particle and grain sizes of the sediments and the low analyte concentrations, it is considered that there is adequate consistency between the laboratories, including handling and analytical techniques.

5.2.5 Acid sulfate soil duplicates

Duplicate ASS samples were collected to assess the variability and precision of both the sampling procedure and the analytical laboratory. The RPD was calculated for each ASS parameter and is recommended to fall within the following limit:

- For values < 10 X LOR, any RPD value is acceptable
- For values between 10 and 20 times LOR, 0% to 50% RPD is acceptable
- For values > 20 times LOR, 0% to 20% is acceptable.

A total of eight ASS duplicates were sampled within the investigation area during the Project geochemical investigation. RPDs were calculated and reported within the threshold with the exception of the samples presented in Table 5.3. QA/QC summary tables are provided in Appendix F.

Table 5.3 ASS duplicates exceeding the recommended RPD

Excess Acid Neutralising Capacity (23Q)	12.8	7.51	52.1
Acidity – Excess Acid Neutralising Capacity (a-23Q)	2,560	1,500	52.2
Sulfidic – Excess Acid Neutralising Capacity (s-23Q)	4.1	2.4	52.3
BH59 0.5m			
Peroxide Calcium (23Wh)	0.4	0.5	22.2
Acid Reacted Calcium (23X)	0.16	0.29	57.8
Acidity – Acid Reacted Calcium (a-23X)	78	143	58.8
Sulfidic – Acid Reacted Calcium (s-23X)	0.12	0.23	62.9
Excess Acid Neutralising Capacity (23Q)	1.12	1.96	54.5
Acidity – Excess Acid Neutralising Capacity (a-23Q)	223	391	54.7
Sulfidic – Excess Acid Neutralising Capacity (s-23Q)	0.36	0.63	54.5

Review of the ASS duplicates indicated an overall consistency between primary and duplicate samples suggesting adequate precision from sample collection, handling and laboratory analytical techniques.

5.3 Summary of data validation

A total of 14 field triplicate results and 15 inter-laboratory duplicate results exceeded the recommended target RSD. These exceedances are likely due to the inherent heterogeneity of the sample (i.e. variable mixture of particles and grain sizes). Higher variations can also be expected for samples with low analyte concentrations, and higher for organic analytes than for inorganics.

The laboratory and field QA/QC are considered to comply with the NAGD requirements. The analytical results are therefore representative of the physical and chemical characteristics of the sediment.

Aurecon deems the quality of the analytical component for the Project geochemical investigation acceptable.

6 Conclusions

The Project geochemical investigation was undertaken in compliance with the approved SAP and NAGD (2009) by using the vibrocoring process, a NAGD recognised approved device for geochemical sampling, and by drilling and sampling at the required density and to the depth of sediments that have the potential to be contaminated. Additional sampling was also undertaken during the geotechnical investigation in locations and depths beyond the scope of the approved SAP and NAGD (2009).

Where guideline value exist under NAGD (2009), an assessment against these was undertaken. Where no values are present under NAGD (2009), a comparison against locally derived reference values and other locally derived reference data (equivalent to the NAGD (2009) term regional ambient baseline levels) was undertaken.

The 95% UCL of all metals and metalloids were below the relevant NAGD (2009) screening levels. A small number of arsenic, chromium and nickel samples demonstrated values slightly above the NAGD screening levels; however, none of these exceedances were recorded at levels greater than their respective NAGD high levels.

Manganese was also recorded at elevated concentrations within the samples. While the deeper sediments did report a 95% UCL for manganese that was higher than the 500mg/kg EIL, these concentrations are likely to be naturally occurring and are in line with levels previously reported within the Port Curtis area in previous studies (e.g. Angel et al. 2012; GHD 2009a), below values observed by Anastasi and Wilson (2010) in Port Curtis of up to 9,000mg/kg, and below the average abundance of manganese (850mg/kg) observed in Australian soils (AusIMM 2011).

No BTEX, PCBs, OCP and OPP concentrations were detected above the LOR with the samples analysed. A small number of samples recorded TPH values over the laboratory LOR of 3.0mg/kg and when adjusted to 1.0% TOC, the 95% UCL reported a value of 189.9mg/kg.

Half of the samples detected concentrations of TRH above the laboratory LOR with the maximum recorded being 19mg/kg. When the data is normalised to 1.0% TOC, the 95% UCL remains significantly below the NAGD screening level at 315.3mg/kg.

A small number of samples reported PAHs above the laboratory LORs. The sum of the PAHs was low with the normalised data (to 1.0% TOC) reporting a maximum value of 2,300 µg/kg and 95% UCL of 199 µg/kg, which is significantly below the NAGD screening level of 10,000 µg/kg.

Sampling and analysis for dioxins was undertaken during the Project geochemical investigation as limited dioxin testing had been previously carried out within the outer harbour channels. Dioxin concentrations from the Project chemical investigation were below the Dutch Intervention Levels and Canadian PELs, were in line with previous testing undertaken by EHP in 2012 and were typical of marine sediments around Australia when compared with the National Dioxins Program (Müller et al. 2004).

While AASS and PASS material were generally absent from the sediments within the investigation area, there were discrete locations where acidity was detected, indicating pockets of ASS that would require management. However, the presence of shell material throughout the investigation area provides the sediments with an acid neutralising capacity, which lowers the risk of acid being produced during dredging and dredged material placement. Management measures will be developed in the Project ASS Management Plan.

As such, geochemical results from this investigation have demonstrated that the sediment from the investigation area and the area to be dredged is **clean** as per NAGD (2009) and is therefore chemically suitable for unconfined dredged material placement at sea and chemically suitable for placement within a reclamation area within or adjoining Port Curtis. Therefore, further testing such as elutriate and bioavailability testing is not required.

The appraisal of laboratory and field QA/QC procedures and assessments indicates that the results comply with the NAGD (2009) requirements. The analytical results are therefore representative of the physical and chemical characteristics of the sediment.

1 Introduction

1.1 Background

The Port of Gladstone has been identified by the Queensland Government as a major industrial centre for the future of Australia. It is Queensland's largest multi-commodity port, the world's fifth largest coal export terminal, and one of the busiest ports in Australia, vital to the local, state and national economies. Major exports from the port include coal, alumina, cement, petroleum, aluminium and agricultural resources. It is estimated that 250-300 million tonnes of product will be handled annually by the Port within the next 50 years (GPC 2012).

The introduction of the Liquefied Natural Gas (LNG) industry to the Gladstone region and the commencement of the Wiggins Island Coal Export Terminal (WICET) will substantially increase the throughput of the Port of Gladstone in the near future.

The current ability of the Port to accommodate high volumes of shipping traffic is limited by the channel depth and lack of passing capacity in the one way channel. Due to increasing development pressures and access demands from present and future Port developments, there is a need to duplicate the channel to support the growth of the Gladstone region.

The duplicate channel is proposed to be developed parallel to the existing Gatcombe and Golding shipping channels, facilitating a two-way rite of passage from the outer harbour, around East Banks, to the western side of Facing Island. This will release a bottleneck which will likely result with the increase in the total number of vessels handled annually in order to meet the committed trade.

1.2 Dredging description

1.2.1 Location of dredging

Gladstone Ports Corporation (GPC), as the governing authority of the Port of Gladstone, proposes to dredge a duplicate shipping channel, running parallel to the existing Gatcombe and Golding Cutting shipping channels promoting two-way passage. The proposed duplicate channel will be approximately 15.23 km long and dredging is proposed to be undertaken to an ultimate depth of RL-16.1 m, with a channel width (toe to toe) ranging from 180 to 200 m (refer Figure 1-1). The channel footprint is approximately 382 ha, however due to the existing bathymetry in the Port of Gladstone, the total area requiring dredging (ie above -16.1 m LAT) is less, being 247.8 ha. This equates to approximately 12.59 Mm^3 of seabed material (including over-dredging) requiring removal during the dredging programme.

Two dredging options are proposed and will be selected upon availability of dredging equipment and operations within the Port of Gladstone. The likely volumes and timing of each dredging option is outlined in Table 1.1.

Coordinate system: GDA_1994_MGA_Zone_56

Port of Gladstone Channel Duplication Sampling and Analysis Plan

Figure 1-1: Proposed Dredge Footprint

Two options are being considered for the dredging works depending on the depth requirement (as dictated by the potential user market). Option 1 is comprised of a staged dredging program with Stage 1 dredging to a depth of -13.5 m LAT and its Stage 2 dredging to the full ultimate dredge depth of -16.1 m LAT. Option 2 dredges to the ultimate dredge depth in one dredging program rather than the staged approach of Option 1. Figure 1-2 illustrates the dredging required for Option 1, Stage 1. Figure 1-3 illustrates the ultimate dredge footprint for both Options.

Table 1.1 Dredging options, location, volumes and timing

Stage	Location	Design depth (m LAT)	Timing (months)	Volume (Mm^3)*	Area (ha)
Option 1					
1	Gatcombe and Golding Cutting	-13.5	12	7.25	179.6
2	Gatcombe and Golding Cutting	-16.1	8	5.34	247.8
Option 2					
-	Gatcombe and Golding Cutting	-16.1	20	12.59	247.8

Table note: *Includes 0.3 m (depth) allowance for potential over-dredging

1.2.2 Equipment and methodology

The dredging is expected to commence in 2017 or later, with the commencement date being dependent on shipping demand from expansion of existing and new projects in Gladstone. The estimated duration of dredging is expected to be approximately 20 months with dredging equipment expected to operate 24 hours per day, 7 days per week.

It is proposed that a combination of different dredge vessels will be used for the Channel Duplication Project, including:

- Trailer suction hopper dredges (TSHD)
- Backhoe dredges (BHD)
- Cutter suction dredges (CSD)

Preliminary investigations have not identified rock within the dredge footprint and as such blasting will be avoided where possible to prevent disturbance to marine megafauna in the area. However, it is necessary to include a blasting option should hard or fractured material be encountered that cannot be managed by the dredging machinery.

The dredging methodology and equipment are dependent on the dredge material placement area(s), dredging depth, type of material to be dredged, Commonwealth and State approval conditions, and the dredge contractor.

The dredge methodology adopted will be subject to Maritime Safety Queensland's (MSQ) Regional Harbour Master acceptance of the successful dredge contractor's detailed execution plan. The dredge contractor will also need to comply with MSQ's Standard for Marine Construction Activities within Gladstone Harbour (Department of Transport and Main Roads 2012).

Recent sampling and dredging programs undertaken within the proposed Channel Duplication footprint are predominantly related to the maintenance dredging of the shipping channels, swing basins and berths undertaken by GPC (GHD 2012; GHD 2006). A summary of the previous dredging campaigns and sediment results in the areas within and adjacent to the proposed dredging footprint is provided in Sections 2.2.2 and 2.2.3.

Port of Gladstone Channel Duplication Sampling and Analysis Plan

Figure 1-3: Proposed Dredge Footprint - Stage 2 (-16.1mLAT)

While sediments within the Port of Gladstone are generally considered as '*probably clean'* (as defined by the NAGD 2009) through the results of previous sampling and dredging programmes (refer Section 2.2), this information was only used to inform the sampling methodology and the information was not utilised to reduce the number of sampling locations, as allowed by NAGD (2009).

1.3 Purpose of this report

This Sampling and Analysis Plan (SAP) outlines the proposed sampling plan and program required to characterise the contamination status of the sediments within the proposed Channel Duplication footprint. The results of the sampling program will be used to undertake an assessment of the suitability of the sediments for sea disposal (if required) under the Commonwealth *Environment Protection (Sea Dumping) Act 1981* and other permit applications required for capital dredging.

This SAP addresses Phase I – *evaluation of existing information* and Phase II – *sampling and analysis of sediments* as detailed in NAGD (2009). If required, Phase III, Phase IV and Phase V of NAGD (2009) will be addressed through a Supplementary SAP.

A separate SAP will be developed for the dredge disposal location(s).

The results of the sampling program will also support the Environmental Impact Statement (EIS) for the Port of Gladstone Gatcombe and Golding Cutting Channel Duplication Project. The SAP has been prepared by Aurecon Australia Pty Ltd (Aurecon) on behalf of GPC with reference to the following guidelines:

- National Assessment Guidelines for Dredging (NAGD) (2009)
- *National Environment Protection (Assessment of Site Contamination) Measure 1999* as amended in April 2013 (National Environment Protection Council 2013)
- Australian and New Zealand Water Quality Guidelines (ANZECC/ARMCANZ 2000)
- Queensland Water Quality Guidelines (DEHP 2013)
- Monitoring and Sampling Manual (DEHP 2010)

2 Description of Port Curtis

2.1 Geology

The geology of the Gladstone region has been mapped by the Geological Survey of Queensland, as shown on the 1:100,000 Gladstone Sheet 9150 (DEEDI 2005). The geologic map indicates that Curtis Island is underlain by rocks from the Palaeozoic-Devonian Wandilla Formation. The Wandilla Formation normally consists of sequences of mudstone, quartz greywacke and chert units, which are overlain by Quaternary alluvial, colluvial and marine sediments.

The geological survey mapping does not extend offshore to the Channel Duplication Project dredge footprint. However, it is likely that alluvial deposits carried down the Boyne River will be encountered offshore within the Project footprint. The undifferentiated alluvium layers stemming from the Boyne River are likely to be of Quaternary age and comprise a mixture of clay, silt, sand and gravel.

The stratigraphy of the proposed dredge footprint is likely to comprise the following:

- Young (Holocene) Alluvium (marine sediments)
- Underlain by old (Pleistocene) Alluvium
- Underlain by bedrock of the Wandilla Formation

Previous works have shown that the Port Curtis area usually demonstrates young alluvium comprising of a thin layer of Holocene aged estuarine clay and recently deposited marine sediments, with a thickness from 0.5 m to approximately 5 m in un-dredged areas, and is described as soft clay and loose sand/gravel with shell fragments.

The young alluvium is typically underlain by residual clays of older alluvium, comprising sandy clay, clayey sand, gravelly sand and clay. The gravel and sand are typically intersected in discrete pockets up to 1 m thick. This is underlain by extremely weathered bedrock of the Wandilla Formation.

Dominant substrate at all depths is usually sand and then clay; however deeper samples taken during the Western Basin Dredging and Disposal Project EIS sampling found higher proportions of gravels with the finer sediments being located generally within the top 0.5 m with gravel or sand layers likely to be located in the top 10 m of sediment.

2.2 Previous investigations and potential pollution sources

2.2.1 Potential pollution sources

The Gladstone region contains the city of Gladstone and a variety of coastal and hinterland townships, including Boyne Island/Tannum Sands, Yarwun, Targinie, Miriam Vale and Calliope. Industries within the catchment include pastoral, agricultural and processing and manufacturing. Major processing and

manufacturing industries located within the Gladstone region are summarised in Table 2.1. Major imports and exports handled within the Port on behalf of local industries and industries located within the Central Queensland hinterland are provided in Table 2.2. Potential pollutant sources in the Port of Gladstone and the associated contaminants are listed in Table 2.3 and are used to inform the analysis of sediment samples (refer Section 3.2.6).

Table 2.1 Major industries in the Gladstone region

Industry name	Industry type
QAL – Queensland Alumina Ltd	Alumina refinery
Rio Tinto Aluminium Yarwun	Alumina refinery
Boyne Smelters Limited	Aluminium smelter
Cement Australia	Cement and clinker plant
NRG – NRG Gladstone Operating Services Pty Ltd	Coal fired power plant
Auckland Point Terminal	Wharves – bulk trades, grain, petroleum products, containers and break bulk products
Barney Point Coal Terminal	Coal terminal
RG Tanna Coal Terminal (RGTCT)	Coal terminal
WICET*	Coal terminal
Arrow Energy LNG*	LNG facility
Australia Pacific LNG (APLNG)*	LNG facility

Table 2.3 Potential pollutant sources and contaminants of concern in the Port of Gladstone

Industry	Potential pollutant sources	Associated contaminants of concern
Shipping	Hydrocarbons (fuels and oils)	Total recoverable hydrocarbons (TRH) Benzene, toluene, ethylbenzene, xylene (BTEX)
	Anti-fouling paints	Polycyclic Aromatic Hydrocarbons (PAHs) Organotins (Tributyltin (TBT), Dibutyltin (DBT) and Monobutyltin (MBT))
	Spillage of product during import and export (bauxite, coal, clinker, alumina etc)	Heavy metals (including Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag, Zn) PAHs TRH BTEX
Natural geology	Metals (especially arsenic and nickel)	Heavy metals (including As, Mn, Ni, Ag, Zn)
Industrial discharges	Intentional and/or unintentional waste products discharged from nearby industries	Heavy metals (including Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag, Zn) PAHs TRH Polychlorinated biphenyls (PCB)
Landfills	Metals and other leachates – few likely in Gladstone as only small inactive landfills present close to the coast	Heavy metals (including Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag, Zn)
Agriculture and horticulture	Herbicides, pesticides and fertilisers– however it should be noted that agriculture/horticulture has reduced in the Gladstone area in recent years	Organochlorine and Organophosphate pesticides (OCP and OPP) Ammonia Nutrients (eg total phosphorous and total nitrogen)
Stormwater	Urban stormwater discharges	Heavy metals (including Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag, Zn) PAHs TRH BTEX
Sewage treatment plants	Secondary treated water re-used at local industrial sites	Heavy metals (including Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag, Zn)

Source: GHD (2012)

As can be seen from the export / import history of Port Curtis, there are few inputs to the system of arsenic, zinc, silver or manganese. This further demonstrates that the previously recorded

exceedances over the NAGD (2009) Screening Levels of these elements in sampling undertaken across the Port Curtis area are likely due to naturally occurring geological deposits rather than anthropogenic inputs to the system.

2.2.2 Previous dredging campaigns

The Port of Gladstone has a long history of dredging and disposal of dredged material both onshore and offshore. Table 2.4 lists previous dredging and sea dumping permits that have been applied for and received by GPC (previously known as CQPA and Gladstone Port Authority) under both State and Commonwealth legislation since the 1960's. Please note that total dredging volumes approved may not have always been dredged and there may be cross-over between approved dredge volumes between Commonwealth and State Government approvals (ie total volume approved/dredged in Gladstone is not a simple addition of the total volumes listed in the table).

Table 2.4 GPC dredging and sea dumping history

Year	Dredge location	Permit type	Permit number	Agency	Legislation	Issued/ expired	Volume (m^3)	Sea dump site
1965	Auckland Point Berth and swing basin	Dredging and Sea Disposal	-	Department of Harbours and Marine (DHM)	*Harbours Act 1955 - 1972*	Issued: 15/07/65	480,000 (Auckland Point)	Picnic Island Dump Ground
1975	Not stated	Section 86 & Sea Disposal	-	DHM	*Harbours Act 1955 - 1972*	Issued: 12/12/75		Near Boyne Channel
1979	Auckland Point to Clinton Coal Facility Channel	Section 86 & Sea Disposal	-	DHM	*Harbours Act 1955 - 1978*	Issued: 7/06/79		Inside harbour
1982	Dredging Marina Basin between Auckland Inlet and the Calliope River	Section 86	-	DHM	*Harbours Act 1955 - 1982*	Issued: 27/05/85	12,000,000	
1986	Clinton Channel, Auckland Channel, outer channel, Clinton Berth & Clinton Swing Basin		-	DHM	*Harbours Act 1955 - 1983*	Issued: 10/06/86	2,500,000	
1987	Outer Channel	Section 86	-	DHM	*Harbours Act 1955*	Issued: 31/07/86	(extension of permit time – 1986 works)	
1988	Fisherman's Landing and Targinie Channel	Section 86	H-466	DHM			(extension of permit time – 1986 works)	
1993	Maintenance and Capital dredging - Outer Channel (deepening)	Sea Dumping Permit	-	Commonwealth Environmental Protection Agency (CEPA)	*Environment Protection (Sea Dumping) Act 1981*	Issued: 10/03/93 – Expired: 10/03/94	1,000,000 (capital and maintenance)	East Banks
1994-1995	Maintenance and Capital dredging - Outer Channel (deepening) extension of permit from 1993	Sea Dumping Permit	-	CEPA	*Environment Protection (Sea Dumping) Act 1981*	Issued: 23/02/94 – Expired: 10/03/95	Extension of permit time (1994-1995 works above)	East Banks

Year	Dredge location	Permit type	Permit number	Agency	Legislation	Issued/ expired	Volume (m^3)	Sea dump site
1995	Maintenance Dredging - Golding Cutting	Sea Dumping Permit	-	CEPA	*Environment Protection (Sea Dumping) Act 1981*	Issued: 17/05/95 - Expired: 17/06/95	3,000 (maintenance)	East Banks
1996	Maintenance Dredging and spoil removal	Sea Dumping Permit	-	CEPA	*Environment Protection (Sea Dumping) Act 1981*	Issued: 12/10/96 Expired: 17/06/95	100,000	East Banks
1997	Fisherman's Landing & Targinie Channel Areas A, B and D	Section 86	H-466 / CR2162	Department of Environment and Heritage (DEH)	*Harbours Act 1955*	Issued: 1/12/97 – Expired: None		
1997	Dredging and interim spoil disposal	Section 86 Amendment	-	DEH	*Harbours Act 1955*	Issued: 10/12/97 – Expired: None		Fisherman's Landing (temporarily)
1997	Maintenance and Capital dredging - Outer Channel	Section 86	-	DEH	*Harbours Act 1955*	Issued: 31/07/86 – Expired: None	100,000	East Banks
1997	Amendment to Maintenance and Capital dredging - Outer Channel	Sea Dumping Permit Amendment	-	CEPA	*Harbours Act 1955*	Issued: 28/04/97 – Expired: 15/10/97	900,000	East Banks
1997-1998	Amendment to Maintenance and Capital dredging - Outer Channel	Sea Dumping Permit Amendment	-	CEPA	*Harbours Act 1955*	Issued: 32/09/97 – Expired: 31/03/98	Extension of permit time	East Banks
1998	Golding Cutting Bypass Channel & Maintenance Dredging	Sea Dumping Permit	-	CEPA	*Environment Protection (Sea Dumping) Act 1981*	Issued: 22/04/98 – Expired: 22/04/99	60,000 (capital)	East Banks
1998	Shipping channels and berths	Sea Dumping Permit	-	CEPA	*Environment Protection (Sea*	Issued: 22/04/98 – Expired: 22/04/00	100,000 (maintenance)	East Banks

All material dredged in recent years has had sampling and analysis undertaken prior to dredging and all material has been determined as suitable for its intended disposal location. A summary of recent dredging programmes with corresponding sampling programmes is provided in Table 2.5.

The majority of sediment sampling within Port Curtis has previously occurred as part of the dredging campaigns within the inner channels, generally north of the Calliope River (ie the Western Basin Project). The location of the proposed Channel Duplication Project in shown in relation to previous capital dredging and maintenance dredging programmes within Port Curtis are illustrated in Figures 2-1 and 2-2, respectively. The locations of previous sediment sampling are also illustrated in Figure 2-3.

Table 2.5 Recent dredging programmes in the Port of Gladstone

Project	Timing of dredging	Volume (Mm^3)	Disposal	Timing of sampling programme
Western Basin Dredging and Disposal Project (Western Basin Project) (GHD 2009a)	May 2011 – September 2013	25	Fisherman's Landing Northern Expansion and Western Basin reclamation area East Banks Dredge Material Placement Area (DMPA)	16 November 2008 – 17 June 2009 29 July – 5 August 2009 23 – 27 August 2009 21 – 22 September 2009
GLNG Project (URS 2009)				22 July – 15 October 2008
WICET Project (Connell Hatch 2006)	May 2012 – February 2013	2.9	WICET Reclamation Areas	23 January – 15 July 2006
Maintenance dredging of the shipping channels, swing basins and berths (GHD 2012; GHD 2006)	Annual	1 (across 5 years)	East Banks DMPA	19 – 23 June 2012 17 – 24 July 2006

2.2.3 Previous sediment investigation results

A review of previous sediment data from the Port Curtis area has indicated that although Gladstone is an urban and industrial area, results show relatively few incidences of sediments with elevated metal results. A review of the previous sediment investigation works undertaken for GPC indicate that approximately the top 30 cm of sediment within Port Curtis is likely to be post 1950s with this sediment band being the most likely (if any) to contain contaminants from anthropogenic inputs. This is in agreement with Vicente-Beckett *et al.* (2006) who demonstrated that anthropogenic influenced sediments are likely to only occur in the top 0.28 m. Below this depth, elevated levels of metals, if detected, are likely to be naturally occurring and related to geology within the area.

The occurrence of naturally elevated levels of some metals was demonstrated by Connell Hatch (2006), who reported elevated levels of silver at depths of >6 m within the sediments tested offshore of Port Curtis. The Cooperative Research Centre (CRC) (Apte *et al.* 2005; Apte *et al.* 2006; Vicente-Beckett *et al.* 2006) also reported elevated levels of arsenic at depth and attributed the arsenic levels as being due to natural geology rather than anthropogenic in origin.

In addition to the large array of geotechnical investigations, a number of reports relating to water and sediment quality, in relation to environmental testing levels, are also available for the Port Curtis area. The earliest of these studies examining the sediment dates back to the early 1990s (as reported in GHD 2012), with the most recent being the Western Basin EIS (GHD 2009a). Most of the studies were undertaken in order to inform dredging campaigns (both capital and maintenance) or to support dredge license applications. Although the currency of the data is now greater than the preferred five

Figure 2-3: Previous Sampling Programmes

years (as specified in the NAGD 2009), since the data was collected to supply geotechnical and environmental information, it is considered appropriate for informing on the background locality information to these dredging works.

A comprehensive sampling programme was undertaken for both the Western Basin EIS (GHD 2009a) and the Fisherman's Landing Northern Expansion Project (GHD 2009b). The Western Basin sampling comprised of a total of 189 samples with extensive environmental testing. This work demonstrated that the presence of minor concentrations of anthropogenic contaminants and naturally occurring compounds in individual samples across the areas to be dredged. Individual results that were above NAGD (2009) and/or Draft Guidelines for the Assessment and Management of Contaminated Land in QLD (EPA 1998) – Environmental Investigation Levels included arsenic, cadmium, copper and manganese levels. Individual samples also recorded concentration of BTEX, hydrocarbons and individual PAHs above the limits of reporting but below the relevant guidelines.

Angel *et al.* (2010) investigated dissolved metal levels in Port Curtis and concluded that nickel and manganese are likely to be released by natural processes such as reduction of manganese (hydr)oxides and leaching by the lower sediment and water pH.

Arsenic has previously been demonstrated to occur naturally within the Port with Vicente-Beckett *et al*. (2006) determining that the concentrations of arsenic (as well as nickel and chromium) in the Port Curtis region were at natural background levels very close to the Australian and New Zealand Environment and Conservation Council (ANZECC) ISQG-low guidelines.

The following sections provide further detail on those metals/metalloids (namely arsenic, manganese, silver and zinc) that have consistently been recorded within sediment samples during the previous investigations at levels above the NAGD (2009) Screening Level and, as such, can be regarded as 'Contaminants of Concern' under the NAGD (2009).

2.2.3.1 Arsenic

Sediment testing within the Port Curtis area has consistently reported levels of arsenic above the NAGD Screening Level for a number of the dredge programme investigations. Sediment sampling for the Western Basin Project recorded arsenic concentrations exceeding the NAGD Screening Levels on 56 occasions (5% of all samples). Of these samples, only 11 (1% of all samples) were obtained from the top 0.5 m of sediment, indicating the sediments contain a natural source of arsenic, rather than an anthropogenic source.

Geochemical testing for the WICET Project identified three samples of the 75 samples analysed (equating 4%) that reported arsenic concentrations exceeding the NAGD Screening Levels. These samples were all taken at a depth greater than 6.0 m.

Sediment sampling undertaken for the GLNG Project recorded 12 samples (7% of all samples) exceeding NAGD Screening Levels for arsenic. Of these, half the samples were taken within the top 0.5 m layer of sediment.

The QCLNG Jetty Optimisation Study (Geocoastal Australia 2009) investigated the sediment composition in Port Curtis. The study determined a strong relationship between arsenic-containing sediments and residual and weathering products of the Wandilla Formation of Curtis Island.

Recently, sediment sampling conducted for maintenance dredging of the shipping channels (GPC 2012) recorded elevated concentrations of arsenic above NAGD Screening Levels in four samples from a total of 47 samples with the samples all taken within the top 1 m of sediment.

Previous testing for maintenance dredging in 2006 also recorded 17 samples above the Screening Levels but below the NAGD high value (equating 53% of all samples with the 95% UCL for arsenic

exceeding the NAGD Screening Level. Again, these samples were all taken within the top 1 m of sediment.

In the samples taken for maintenance dredging, although the sediments reporting elevated arsenic levels were within the top 1 m, it is impossible to ascertain whether these sediments were recent anthropogenic deposits or older deposits that naturally contain arsenic deposits that have slumped into the maintenance channel.

However, the widespread occurrence of arsenic in local sediments is consistent with the local geological formations surrounding Port Curtis. Arsenic is common in marine mudstones (Wandilla Formations) where it is substituted for sulfur in marine pyrite and in mineralised sequences surrounding granite intrusions (Mount Larcom region). The arsenic is often immobilised into pyrite structures until exposed to weathering. An investigation into sediment contamination in Port Curtis by Vicente-Beckett *et al.* (2006) also identified that heavy metal concentrations, including arsenic, were close to ANZECC ISQG-low guidelines.

2.2.3.2 Manganese

Manganese is an abundant element in the Earth's crust with many minerals containing manganese, of which the two most common are pyrolusite (MnO_2) and rhodochrosite ($MnCO_3$). Mining of manganese was common within the Gladstone area, including the historic Mount Millar manganese mine. Several exploration permits for striking manganese ore deposits are active and located approximately 15 km west of Gladstone.

In Port Curtis, Angel *et al.* (2010) investigated dissolved metal levels, including manganese, and concluded that manganese is likely to be released by natural processes, such as reduction of manganese (hydr)oxides and leaching by the lower sediment and water pH.

As manganese is not specified within the NAGD (2009) guidelines, previous samples from both the Western Basin and GLNG Projects were compared against the Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (EPA 1998), which utilises a Trigger Value of 500 mg/kg. Numerous samples with manganese in excess of this Trigger Value were recorded across the dredge footprints and at all sediment depths.

As would be expected with a naturally occurring metalloid, there was however no clear pattern of distribution of manganese with depth and concentrations at individual boreholes are likely to be a result of multiple erosion and deposition cycles that have occurred over the geologic past.

2.2.3.3 Nickel

While sediment sampling for the WICET Project and Port of Gladstone maintenance dredging did not exceed the NAGD Screening Levels for nickel, sampling for the Western Basin Project recorded 28 exceedances (2.6% of all samples). Of these samples, 22 were recorded at depths greater than 0.5 m and outside the sediment layer of anthropogenic influence. As such, these elevated nickel concentrations are likely to be naturally occurring as sporadic cases of weathered substrate material that have become concentrated.

Sediment samples taken during the GLNG Project exceeded NAGD Screening Levels for nickel on eight occasions (4.7% of all samples). Of these, only two of the eight samples were taken from within the top 0.5 m of sediment and are within the level of anthropogenic influence.

Sediment quality investigations undertaken for QCLNG identified 13 samples (1.1% of all samples) with nickel exceeding NAGD (2009) Screening Levels. Of these samples, 11 were taken from within Pleistocene clays and two were taken in silty clayey gravel/sands immediately above the pre-Holocene boundary. This supports the finding that levels of nickel exceeding the sediment quality guidelines appear confined to pre-Holocene sediments (GHD 2009a). Elevated nickel concentrations

in consolidated clays have previously been identified in the Port of Melbourne and in Ralphs Bay, Tasmania (Aurecon 2010).

As previously discussed, Angel *et al.* (2010) found that the water concentrations of some heavy metals exceeded the background levels in surrounding coastal waters. These heavy metals included nickel and manganese, which were likely to have been released by natural processes.

2.2.3.4 Silver

During sampling for the WICET Project, the NAGD Screening Levels for silver were exceeded in nine samples with seven of the samples in excess of the NAGD High Level of 3.7 mg/kg. All these samples were taken at depths ranging from 2 to 11 m. It was suggested in the WICET Project EIS (Connell Hatch 2006) that from the geomorphology of the area (ie alluvium likely transported by the Calliope River) and the depths of exceeding samples, that silver is a natural occurrence in Port Curtis and was located too deep to represent anthropogenic contamination.

2.2.3.5 Zinc

Zinc has been identified in the sediment within the Port of Gladstone, at concentrations exceeding the NAGD Screening and High Levels.

Sediment sampling for the WICET Project identified one sample with zinc above the NAGD Screening Levels (1.3% of all samples). Two samples were recorded in a single borehole for the Western Basin Project (1.8% of all samples) that exceeded the NAGD High Level of 410 mg/kg. These samples were collected from BH 2A-22 (from the APLNG berth pocket adjacent Curtis Island) at depths of 6 – 6.4 m and 13 – 13.4 m, which are depths well below the likely anthropogenic influence and therefore are likely to be attributable to natural geological influence. Zinc is naturally found in basalt, biotite (a constituent of granite), magnetite and shale, which are common throughout the Gladstone region. Despite the exceedances, the 95% upper confidence limit (UCL) for zinc did not exceed the NAGD High Level.

2.2.3.6 Other metals and contaminants

A few occurrences of other metals such as cadmium, copper, lead, mercury and TBT have also been detected over the NAGD (2009) Screening Levels (although TBT has not been recorded in recent years) but none (other than PAHs as discussed below) demonstrated 95% UCL over the NAGD Screening Levels and as such have not been discussed further.

A single sample recorded concentrations of the PAHs, acenaphthene and fluorene, in excess of the NAGD (2009) Screening Levels during the maintenance dredging sediment sampling conducted in July 2006. As a result, the 95% UCL exceeded the NAGD Screening Levels for these contaminants. Subsequent elutriate testing of the sample indicated that water column impacts were not likely during ocean disposal and re-extraction of the primary sample was clean, which suggested that the original sample was particularly heterogeneous. The presence of tar or coal was provided as a possible explanation for the anomaly (GHD 2006).

Sediment sampling was conducted by the Queensland Department of Environment and Heritage Protection during February–March 2012 at 31 sites throughout Port Curtis. Testing covered a wide range of metals and metalloids, pesticides, and petroleum hydrocarbons, including PAHs and BTEX (the aromatic hydrocarbons benzene, toluene, ethylbenzene and xylene), as well as PCBs, dioxins and dioxin-like chemicals. Almost all measured concentrations were less than guideline trigger values, and the very few exceedances of one metalloid (arsenic) were not significantly over the guideline. For dioxins and dioxin-like chemicals, the levels in Port Curtis sediments were consistent with the range in

urban/industrial locations elsewhere in Australia (Department of Environment and Heritage Protection 2012)

3 Sampling and Analysis Plan

3.1 Introduction

3.1.1 Objectives

This SAP has been prepared to meet the requirements outlined in the NAGD (2009) for the assessment of sediment quality (Phase I and Phase II).

The SAP also provides guidance for the assessment of the contamination status of the material to be dredged, including the appropriate sample collection, handling, storage, analysis methods and quality control requirements.

The objectives of the SAP are to:

- Identify and justify the analytes to be tested
- Develop a set of procedures for assessing the data and ensuring the data obtained is acceptable and sufficient for assessing the suitability of the dredge material for disposal
- Develop a set of procedures to provide a statistically valid representation of the physical and chemical properties of the dredge material
- Develop procedures for quality assurance and control and data validation for field sampling and laboratory analysis
- Characterise the sediments to be dredged during the Channel Duplication Project
- Determine the suitability of sediments for offshore disposal

The following sections outline the procedures for sampling and sub-sampling consistent with the Appendix D of the NAGD (2009), including sample handling, preservation, storage and quality assurance (QA) and quality control (QC). It should be noted that while field procedures will be developed by the Contractor, they will be required to adhere to the Commonwealth Department of the Environment (DoE) approved SAP and NAGD (2009).

3.1.2 Responsible parties

GPC is the proponent for the proposed Channel Duplication Project at the Port of Gladstone. GPC has engaged Aurecon for the preparation of this SAP and provision of the results of the sediment sampling as supporting information for the EIS for the Channel Duplication Project.

GPC will undertake an investigation into dredge material placement options for the dredge material. This SAP will inform this investigation particularly as offshore disposal requires an area of similar physical and chemical characteristics. The SAP will also provide supporting information for the authorities that are assessing the development approvals for this Project.

A laboratory holding National Association of Testing Authorities (NATA) certification for the required analyses will be contracted to undertake chemical analysis of the samples.

3.1.3 Occupational health and safety

Sediment sampling will be undertaken in reference to a suitable occupational health and safety plan. This includes sample collection, processing and handling, and will be supplemented by health and safety documentation from the vessel contractor. This is to ensure the safety, health and welfare for personnel for all work performed within the contracted work-scope, and that the safety, health and welfare of others, including the public and the natural environment are not affected by that work. In particular, the occupational health and safety plan will address safety in relation to working over water and addressing potential adverse weather conditions.

Given the majority of sediment to be collected is *probably clean*, risk to human health from hazardous materials is not anticipated. However, appropriate sample collection, processing and handling techniques will be developed as part of an occupational health and safety plan and will be implemented during sediment sampling.

3.1.4 Personnel and vessel requirements

The vessel from which sampling is undertaken will have an appropriate sample processing area, free from debris and residue and removed from motors and exhaust, to minimise the potential for sample contamination. The sample processing area will be washed down prior to use.

Two appropriately qualified and experienced environmental scientists (or equivalent) will be on board the vessel to direct, log and provide records of sampling, take photographs, process and package samples in accordance with NAGD (2009) and make sure they are delivered to the analytical laboratory within the required holding times.

3.1.5 Contingency planning

The Contractor and associated vessel employed to undertake sampling will be required to have contingency plans in place for adverse weather conditions and/or equipment malfunction to prevent any impacts on the timing of the field programme.

The Contractor and field staff will also make themselves aware of environmental conditions that may affect sampling, including the depth of water (which is variable across the areas to be sampled), tidal currents and onshore winds.

3.1.6 Review of the SAP

This SAP has been prepared by Aurecon, on behalf of GPC, to comply with NAGD (2009). The results of the SAP will provide supporting information for the EIS and subsequent permit applications required to undertake capital dredging.

The draft SAP will be submitted for review by the Commonwealth DoE and the Queensland DEHP. Final approval will be granted by the DoE as the assessment authority.

The results of the sampling and analysis will be presented within a SAP Implementation Report as supporting information for the EIS and any subsequent permit applications, with a copy of the final SAP as an appendix.

3.2 Sampling of sediments to be dredged

3.2.1 Design of sampling program

According to the NAGD guidelines, capital dredging programmes that are not located in pristine sites in remote or offshore areas, such as the Channel Duplication Project, can calculate the number of sampling locations based on the volume of *potentially contaminated* dredge material. *Potentially contaminated* material is sediment that is contiguous with an area of known contamination, or sediment that has been exposed to known contamination sources (NAGD 2009). It does not include the volume of underlying natural geographic materials which are, except for a boundary layer, expected to be uncontaminated.

Although studies undertaken within Port Curtis indicate that anthropogenic influenced sediments are likely to only occur in the top 0.28 m (Vicente-Beckett *et al.* 2006), it is considered conservative to regard the top 0.5 m as being *potentially contaminated*. As discussed in Section 2.2, the majority of recent sediment sampling for capital dredging within Port Curtis has previously occurred within the inner channels, generally north of the Calliope River (ie the Western Basin Project). The only sediment sampling that has occurred within the outer channels in the past five years occurred in June 2012 for the shipping channel maintenance dredging.

Previous sediment testing from the maintenance dredging in the outer channels of Port Curtis found sediment quality to be compliant with NAGD guidelines and can be considered to be *probably clean*. However, given a conservative approach has been adopted for this SAP, the number of sampling locations will not be reduced based on this assumption.

The full number of sampling locations for the dredge footprint was calculated using the volume of *potentially contaminated* material. The proposed dredge footprint is approximately 15.23 km in length with a channel width ranging from 180 to 200 m (toe to toe) and a maximum additional 40 m required for slope stability in some areas. The total channel footprint, including batter slopes, equates to an area of 3.81 Mm^2. The volume of *potentially contaminated* material is therefore 1.905 Mm^3 if considering a 0.5 m depth of *potentially contaminated* material. The volume of *probably clean* sediments is approximately 10.685 Mm^3, resulting in a total dredge volume of 12.59 Mm^3 (including 0.3 m of over dredging).

Although this *probably clean* material does not require sampling to be undertaken as it contains only underlying natural geographic materials, it is proposed that testing be undertaken at 1 m intervals (with samples taken at 0.5 m intervals and those samples not tested to be stored) in order that the distribution of any naturally occurring metals can be ascertained.

Table 3.1 outlines the number of proposed boreholes in accordance with the NAGD guidelines (2009), where Table 6 of the NAGD (2009) has been linearly extended with:

$$y = 0.025x + 15.547$$

where: y is the number of sampling stations; and
x is the volume of dredge material (x 1,000 m^3).

This approach was utilised rather than power analysis as there is little pre-existing data on the chemistry of the sediments within the dredge pocket.

Table 3.1 Proposed number of sampling locations

Sediment classification	Volume of dredge material (Mm^3)	Minimum number of sampling locations (NAGD) for Phase II sampling
Probably contaminated	1.905	63

Sediment classification	Volume of dredge material (Mm^3)	Minimum number of sampling locations (NAGD) for Phase II sampling
Probably clean	10.685	Not required, however, samples will be taken at 0.5 m intervals for full dredge depth for all boreholes with those taken at the 1 m interval tested

The sampling sites have been randomly allocated in accordance with the method outlined in NAGD (2009). A square grid was laid over the dredge footprint with at least five times the number of grid squares as there is sampling locations (ie 315 grids squares) (refer Figure 3-1). Due to the long and thin nature of the proposed dredge channel, the following additional work was required to allocate the grid squares:

1. The side of each of the grid squares was calculated with a total area ÷ 315 = 12,123.88 m^2. This gives each grid square a required minimum side length of 110.1 m
2. A grid was created with sides of 110.1 m over the full extent of footprint and their centroids
3. A spatial selection of all grid squares and centroids that intersect the footprint was performed
4. 63 random points were allocated, constrained to the centroids selected using ArcGIS 10.1 Advanced – Create Random Points Tool
5. If the point fell outside the actual dredge footprint, it was snapped to the boundary of the dredge footprint – top of batter (while still falling within its grid square)
6. A number of sampling locations were manually relocated following consultation with the Commonwealth DoE to eliminate clustering and create a more even spread of sampling locations. Sample locations moved included 7, 13, 30, 32, 42, 45, 50 and 56.

The sampling locations are displayed in Figure 3-2 and listed in Table 3.2. Samples will be collected at the centre of each grid square with the actual sampling to be taken as close as possible to the GPS coordinates generated.

Figure 3-3 displays the sample locations in relation to the bathymetry of the area, which was used to calculate the actual volume of dredging.

Table 3.2 Sample location selection

Sampling location	Grid number	Easting	Northing	Sampling type

63	3	341162.301	7352377.35	Phase II

Table note: *sampling location moved from outside area of dredging to boundary of dredge footprint (refer item 5 of methodology)
^sampling location relocated following consultation with DoE (refer item 6 of methodology)

Water quality and coastal processes sampling for the purpose of the development of the hydrodynamic model for the Project, while not part of this sampling programme, will be undertaken concurrently. The sampling procedures for water quality and coastal processes will be documented elsewhere. The sampling locations for water quality and coastal processes testing have not yet been finalised and will be determined in consultation with DEHP and the DoE prior to implementation.

3.2.2 Depth of sampling and collection method

Samples will be collected using a vibrocoring method designed to retrieve continuous, undisturbed core samples from unconsolidated and semi-consolidated sediments. The core barrel (approximately 76 mm diameter) is vibrated into the sediment whilst fixed to the vibrocorer head. The sediment in immediate contact of the core barrel forms a 'liquefied' boundary layer by the vibration mechanics enabling the core barrel to penetrate the sediment strata. In the field, GPS coordinates of each sampling site will be recorded and sites plotted on a map of appropriate scale. Differential GPS will be used, giving an accuracy of not less than +/- 10 m.

The corer will be used to collect samples to below the depth of dredging (-17.1 m LAT) or until refusal. The required depth of each core will be determined from bathymetry at each sampling location while in the field but is expected to be approximately 4 m at each hole.

In the unexpected case that the depth of dredging is greater than 6 m at a particular location and the material cannot be sampled by the corer, physical properties of the natural underlying material will be assessed through the geotechnical investigations associated with dredge planning.

3.2.3 Sub sampling of cores

The cores are to be split on recovery and sub sampled on one split only. The other split is to be stored in appropriate conditions in the event that retesting and further Phase II is required.

Following logging of each core, grab samples will be collected along the core in 250 mL glass jars for volatile analysis. The remaining samples will be collected by placing approximately 0.5 m lengths of each representative core into a stainless steel mixing bowl and mixing the sample to make a homogeneous mix.

Port of Gladstone Channel Duplication Sampling and Analysis Plan

Figure 3-3: Sampling Site Locations and Bathymetry

The following intervals will be used for testing of physical and chemical characteristics:

- 0.0 – 0.5 m
- 0.5 – 1 m
- Every 1 m thereafter until below dredge depth

It is likely that five samples will be taken for geochemical testing for each borehole within the actual channel, whilst those boreholes within the slope batter will likely only have a top sample taken.

The remaining samples which have not been analysed will be retained in case further testing is required.

3.2.4 Sample volume and containers

The volume of sediment collected for each sample must be adequate to conduct all required chemical and physical analyses. Based on Table 5 of the NAGD (2009), it is anticipated that 250 mL of sediment per sample/replicate for chemical analysis and 500 mL for particle size will be adequate for the basic Phase II suite.

Samples will be placed in laboratory supplied glass jars with Teflon-lined lids or zip-lock bags as required by the laboratory. Jars will be completely filled with sample. Sample volume and container requirements will be confirmed with the laboratory prior to sample collection.

3.2.5 Field measurements

The following field measurements will be recorded on an appropriate field data sheet:

- Date and time of sampling of each core
- Person conducting sampling, client, project, sample location identifier, GPS coordinates of actual sampling location
- Core logs – each core will be logged with reference to AS 1726 – Geotechnical Site Investigations, before samples are processed. Details recorded will include depth, physical appearance (eg sand, clay), colour, odour, plasticity, sand grain size and presence of organic matter, marine organisms, coal particles, shell layers and other relevant features
- Water quality – each sample will be logged with reference to ANZECC/ARMCANZ (2000) and visual observations such as turbidity (by eye), odour, colour etc will be recorded as well as in situ instrument readings including temperature, dissolved oxygen, electrical conductivity and pH
- Photographs – digital photographs (minimum resolution of 12 megapixels) will be taken of each sediment core and sampling equipment/methodology
- Tides – the tide chart for each day of sampling will be included in the report and water depth at the time of sampling recorded. Observations such as falling/rising tides will also be recorded
- Weather – weather conditions including wind speed, sea state, currents and rainfall for each day of sampling will be recorded

3.2.6 Analysis of sediment samples

3.2.6.1 Geochemical

All samples will be analysed for the following analytes:

- TRH
- Metals and metalloids (Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag, Zn)
- Ammonia
- Nutrients (total phosphorous and total nitrogen)

- Dioxins (12 randomly selected boreholes, sample taken from top 0.5 m)
- OCP and OPP
- PCB
- Organometallics (TBT, DBT, MBT)
- PAHs
- Total organic carbon (TOC)
- BTEX
- Acid sulfate soils

Refer Table 3.3 for further information regarding the analytes to be investigated.

3.2.6.2 Physical characteristics

Settling rates and particle sizes (sieve and hydrometer) will be analysed on selected samples that are representative of the sediment types and layers that are identified.

3.2.6.3 Geotechnical cores

Other physical characteristics, such as bulk density and shear velocities will also be investigated as part of the geotechnical sampling programmes, to provide input into dredgeability and predicted plume generation studies for the EIS.

3.2.7 Data assessment

Results of chemical testing will be assessed for compliance to the Screening Levels specified in Table 2 of the NAGD guidelines (2009) and the revised sediment quality values as provided in Simpson *et al.* (2013) (unpublished). Concentrations of organic contaminants, including organometallics and PAHs, will be adjusted to 1% TOC before being compared to Screening Levels. Statistical analyses of the data will include the calculation of 95% UCL of the mean as specified in the NAGD (2009). Where no NAGD Screening Level exists (eg manganese) the levels outlined in the Draft QLD Contaminated Land guidelines (EPA 1998) will be utilised.

The analysis data will be checked and validated with unusual results rechecked by the laboratory within the holding times.

If contaminants exceed the Sediment Quality Guidelines (High) Levels presented in Table 4 of the NAGD (2009), toxicity tests are required as outlined in Section 3.2.8. If this occurs, a Supplementary SAP will be prepared and submitted to DoE and DEHP for approval and will detail any required Phase III or Phase IV sampling and analysis.

Table 3.3 outlines the Screening Levels and the High Levels for the analytes to be investigated.

Table 3.3 Contaminant Screening and High Levels for sediment

Chemical	Units	NAGD (2009) Practical Quantification Limits (PQL)	NAGD (2009) Screening Level[1]	NAGD (2009) High Level[1]	Draft QLD Contaminated Land guidelines (EPA 1998)

Ethylbenzene	µg/kg	200	-	-	
Xylene	µg/kg	200	-	-	

Table note: [1] Values provided in brackets represent revised sediment quality values as provided in Simpson *et al.* (2013) (unpublished).
[2] For comparison to revised sediment quality values (Simpson *et al.* 2013), concentrations will be normalised to 1.0% total organic carbon

3.2.8 Further analysis (Phases III & IV)

If contaminants of concern are identified at concentrations exceeding the Screening Levels outlined in the NAGD (2009), the deeper sample/s for that location will be analysed. Where concentrations exceed the Screening Levels and deeper samples do not, a Supplementary SAP will be prepared detailing additional elutriate, bioavailability, toxicity and bioaccumulation testing proposed to be undertaken as required and as outlined in Phases III & IV of the NAGD (2009) and in consultation with the DoE and DEHP.

3.3 Data quality objectives and indicators

3.3.1 Data quality objectives

Data Quality Objectives (DQOs) are qualitative and quantitative statements derived from the outputs of the first six steps of the seven steps DQO process that:

- Clarify the study objective
- Define the most appropriate type of data to collect
- Determine the most appropriate conditions from which to collect data
- Specify tolerable limits on decision errors which will be used as the basis for establishing the quantity and quality of data needed to support the decision

The DQO process (AS4482.1-2005) follows a systematic approach for defining the criteria that a data collection design should satisfy, including the number of samples and when, where and how to collect these samples. DQOs are employed to develop a scientific and resource-effective data collection design to assure decision makers that the type, quantity and quality of environmental data are appropriate for the intended application. In addition, decision makers will guard against committing sources to data collection efforts that do not support defensible decisions.

The DQOs for this SAP have been developed to define the type and quality of data required to achieve the objectives stated in Section 3.1.1. The DQOs were selected with reference to relevant guidelines published by the NAGD (2009) and the ANZECC/ARMCANZ (2000), which define minimum data requirements and quality control procedures.

These matters are addressed in the seven-step DQO approach presented in Table 3.4.

Table 3.4 Data Quality Objectives

Process	Response
Step 1: State the Problem	The contamination status of the material proposed to be dredged is required to be assessed in accordance with the requirements outlined in the NAGD (2009)
Step 2: Identify the Decision	The principle objectives of the SAP are as follows: • Identify and justify the analytes to be tested • Develop a set of procedures for assessing the data and ensuring the data obtained is acceptable and sufficient for assessing the suitability of the dredge material for disposal • Develop a set of procedures to provide a statistically valid representation of the physical and chemical properties of the dredge material • Develop procedures for quality assurance and control and data validation for field sampling and laboratory analysis • Characterise the sediments to be dredged during the Channel Duplication Project

Process	Response
	• Determine the suitability of sediments for offshore disposal
Step 3: Identify the Inputs to the Decision	• Dredging design depth and volume • Previous investigations within the Port of Gladstone • Industries and potential pollutant sources within the Port of Gladstone • History of dredging and sea dumping within the Port of Gladstone
Step 4: Define the Boundaries of the Study	The ultimate dredge footprint to -16.1 m LAT is illustrated in Figures 1-1 and 1-3
Step 5: Develop a Decision Rule	The assessment program has been designed to characterise the sediments to be dredged using the following criteria: • NAGD (2009) Screening Levels • NAGD (2009) High Values • Simpson *et al.* (2013) (unpublished). • Draft QLD Contaminated Land guidelines (EPA 1998) where NAGD Screening Levels are not available
Step 6: Specify Tolerable Limits on Decision Errors	The Data Quality Indicators (DQIs) have been established to set acceptance limits on field and laboratory data collected during the investigation
Step 7: Optimise the Design for Obtaining Data	The SAP was developed in accordance with the NAGD 2009. Nominated samples judged as being representative of sediment values will be submitted for analysis as described in Section 3.2.7. Samples are to be analysed by a NATA Accredited Laboratory within approved sample withholding times.

3.3.2 Data Quality Indicators

The DQIs for the assessment are presented in Table 3.5.

Table 3.5 Data Quality Indicators

DQI	Field	Laboratory	Acceptability limits
Completeness	• Sediment proposed to be dredged pose a potential risk to health, safety and the environment and require investigation to characterise and assess the suitability for disposal • Appropriate sampling procedures to be used • Experienced field team to undertake sampling • Correct documentation to be completed	• All required samples analysed • Appropriate methods • Appropriate Limits of Reporting (LORs) • Appropriate PQLs • Sample documentation correct • Sample holding times in compliance	As per NAGD 2009 and Simpson *et al.* (2013) (unpublished).
Comparability	• Correct sample procedures used at each location • Experienced field team • Same type (medium, volume and sampling technique) of samples collected	• Same analytical methods used • Appropriate LORs • Samples submitted to the same NATA accredited laboratory • Analytical data is presented	As per NAGD 2009

DQI	Field	Laboratory	Acceptability limits
		in the same unit	
Representativeness	• Appropriate media sampled • All media identified (ie sediment)	• All required samples analysed	As per NAGD 2009
Precision	• Correct sample procedures used at each location • Collection of appropriate QA/QC samples	Analysis of: • Duplicate samples • Laboratory duplicate samples	Relative percent deviation (RPD) of 30-50%
Accuracy	• Sampling procedures appropriate and complied with • Collection of appropriate QA/QC samples	Analysis of: • Method blanks • Laboratory surrogate spikes • Laboratory control samples • Reference material	• Non-detect for contaminants of concern • 70-130%

3.4 Quality control and quality assurance procedures

3.4.1 Decontamination

Prior to use, the survey vessel must be thoroughly inspected and washed down. Any evident sources of contamination (such as copper or brass, or galvanised or oily surfaces) will be cleaned, covered in plastic and taped down to avoid accidental contamination of any sample. Lead diving weights will be stowed away and work surfaces will be covered with clean plastic sheeting.

3.4.2 Sampling equipment

Stainless steel, uPVC or Teflon equipment will be used, where practicable, to minimise the risk of cross contamination of samples. The following procedure will be used for cleaning the sampling vibrocores, or any equipment used to handle samples, prior to obtaining each sample to be submitted for chemical analysis:

- An initial rinse with seawater
- A detergent solution scrub (Decon 90)
- A seawater rinse
- A final distilled water rinse

3.4.3 Sample collection

All staff collecting sediment samples will wear disposable nitrile, powder free gloves for each individual sample collected. This will ensure no cross-contamination between sample locations and sample depths occurs.

3.4.4 Sample preservation

Once samples are collected and labelled, they will be promptly stored in the dark at less than 4°C (on ice bricks) and transported to the testing laboratory within the specified holding times, ideally within 24 hours. Samples will be collected, preserved, stored and transported according to the requirements of the NAGD (2009) and instructions given by the analytical laboratory accompanied by a Chain of Custody form.

3.4.5 Sample labels

Each sample will be labelled with a sample number. The sample number will be unique to a particular sample and will be recorded with indelible ink on both the waterproof label and the cap of the sample bottle in case the sample label is lost or destroyed.

Table 3.6 identifies the sample types and the prefixes for the specific samples that will be used in the identification of the different samples for the Channel Duplication Project.

Table 3.6 Identification of samples

Sample type	Sample label prefix
Borehole samples (locations 1 – 63)	BH (eg BH01 – BH63)
Triplicates	T (eg T01)
Trip blanks	TB (eg TB01)
Rinsates	R (eg R01)

3.4.6 Analytical testing laboratories

All laboratories used for analysis will be NATA accredited and experienced in the chemical and physical analysis of marine sediments. 5% of samples will be checked with an independent NATA accredited laboratory.

3.4.7 Chain of Custody

Chain of Custody forms will detail all samples collected and dispatched to the laboratory for analysis, including any specific comments or requirements (eg notes that samples are of marine origin and where samples are expected to be contaminated, or where ultra-trace tests are required). Details provided on the Chain of Custody forms will be as follows:

- Sampler
- Nature of sample
- Collection date
- Analysis requested
- Preservation method
- Time sampled
- Condition of samples at dispatch
- Staff contact details

3.4.8 Laboratory QA/QC procedures

In accordance with the NAGD (2009), the NATA accredited laboratories will include a range of QA/QC methods, which are summarised in Table 3.7.

Table 3.7 Laboratory QA/QC procedure details

QA/QC procedure	Analysis rate	Details
Laboratory blank	1 per 20 samples (or fewer)	Laboratory blanks are submitted with each sample batch during analysis to determine the level (if any) of cross contamination that may occur during laboratory preparation, extraction and/or analysis. Analysis of the laboratory blanks should result in contaminant concentrations that do not exceed the detection limit
Laboratory control	1 per 20 samples (or fewer)	Laboratory controls are submitted with each sample batch and contain known concentrations. Analysis of the laboratory controls should result in contaminant concentrations that do not deviate from the known

QA/QC procedure	Analysis rate	Details
		concentration to determine the accuracy of the laboratory analysis
Laboratory spike (surrogate and matrix)	1 per 20 samples (or fewer)	A surrogate laboratory spike involves additions of a known concentration of compounds that are similar to those analysed, but are not likely to be present in the environment. The recovery of these compounds indicates the ability of the laboratory to extract the specified analyte. Surrogate spikes are generally performed on organic compounds A matrix laboratory spike is performed by splitting a sample and spiking it with a known contaminant concentration. The recovery of the contaminant is calculated and used to determine interference from the sediment upon the level of recovery
Laboratory duplicates	1 per 10 samples (or fewer)	Laboratory duplicates uses relative percent difference of an intra-laboratory split sample material to analyse laboratory precision

3.4.9 Analysis of QA/QC samples

In addition to the internal laboratory quality assurance procedures, field replicates and quality assurance replicates will be collected and tested for the basic suite of contaminants of concern. Field QA/QC procedures to be implemented during sampling and analysis are outlined in Table 3.8.

Table 3.8 Field QA/QC procedures

QA/QC procedure	Frequency	Details
Trip blank	Once per day	One container filled with inert material (provided by the laboratory) to be transported with samples and analysed for volatile compounds
Rinsate blank	Once per day	One rinsate container collected during the decontamination process where cross-contamination of samples is likely
Field triplicate	10% of samples	Two replicate samples collected at the same location as the primary sample and analysed to determine the variability of the sediment physical and chemical characteristics
Inter-laboratory duplicate	5% of samples	Replicate samples collected form the same homogenised sediment as the primary sample and analysed by the primary laboratory and secondary laboratory to identify variation associated with sub sample handling and variation in analytical protocol

3.4.10 Validation and checking of laboratory results

Upon receipt of laboratory results, QA/QC results will be checked and the results reviewed for inconsistencies or atypical results. Validation of the laboratory data and field quality control samples will be undertaken according to the requirements of the NAGD (2009) and presented in the report.

3.5 Reporting

Once the approved SAP has been carried out, the SAP Implementation Report will be prepared and will contain the following sections:

- Introduction/purpose of the SAP
- Details of the sampling, including sample locations and depths, sample numbers (including QA samples), completed Chain of Custody forms, field logs, descriptions of the sediments and any issues encountered or deviations from the procedures outlined in the SAP
- Methodology including sample collection, processing, storage and analysis
- Results including compliance to NAGD (2009) Screening Levels and Simpson *et al.* (2013) (unpublished), statistical analyses and data validation. All laboratory results and field data will be appended in full

- QA/QC assessment of field and laboratory data and comparison to the DQOs
- Discussion, including an assessment of the suitability of the dredge material for various disposal options as required under the NAGD (2009)
- Conclusions and recommendations

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **EA150H: Soil Particle Density as required for Hydrometer analysis according to AS 1289.3.6.3 2003 was unable to be performed for sample 18 as insufficient sample was supplied by the client. Typical SPD values used for calculations and consequently NATA endorsement does not apply to hydrometer results.**
- **EA151: ALS does not hold NATA accreditation for Settleability.**
- **EP090: High failing LCS deemed acceptable as all associated analyte results are less than LOR.**
- **EP090: Samples 'PC1 0.5-1.0A' and 'WB1 0.51.0A' show poor matrix spike recovery for Monobutyltin due to matrix interference.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Project	: GPC GEOCHEMICAL INVESTIGATION	QC Level	: NEPM 2013 Schedule B(3) and ALS QCS3 requirement
Site	: ----		
C-O-C number	: ----	Date Samples Received	: 05-FEB-2015
Sampler	: GK	Issue Date	: 26-FEB-2015
Order number	: 245553		
		No. of samples received	: 41
Quote number	: SY/1021/14 V2	No. of samples analysed	: 41

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Ammonia in Sediments	EK255A SD	2	15	**13.3**	**10.0**	✓	NEPM 2013 Schedule B(3) and ALS QCS3 requirement

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP090: Organotin Compounds	4596905-002	----	**Monobutyltin**	78763-54-9	138 %	36-128%	**Recovery greater than upper control limit**
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1502604-001	PC1 0.5-1.0A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP090: Organotin Compounds	ES1502604-008	TRIPLICATE 1B	**Monobutyltin**	78763-54-9	16.2 %	35-130%	**Recovery less than lower data quality objective**
EP090: Organotin Compounds	ES1502604-001	PC1 0.5-1.0A	**Monobutyltin**	78763-54-9	30.0 %	35-130%	**Recovery less than lower data quality objective**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Duplicate outliers occur.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP090S: Organotin Surrogate	ES1502604-032	WB1 0.51.0A	**Tripropyltin**	----	131 %	35-130 %	**Recovery greater than upper data quality objective**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- **No Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- **No Quality Control Sample Frequency Outliers exist.**

Thanks Jacob for picking that up.

Yes this is a mistake on the CoC – Please schedule Duplicate 2A for Aurecon Suite 1.

Kind Regards

Saman Taeidi

Hi Saman,

Can you confirm if sample #9 should really be on hold or was it a mistake on the COC?

Jacob Waugh

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**
- **EK067G: Poor duplicate precision due to sample heterogeneity. Confirmed by re-extraction and re-analysis.**
- **EP090: High failing LCS deemed acceptable as all associated analyte results are less than LOR.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EK067G: Total Phosphorus as P by Discrete Analyser	ES1503303-001	Anonymous	**Total Phosphorus as P**	----	20.0 %	0-20%	**RPD exceeds LOR based limits**
EP132B: Polynuclear Aromatic Hydrocarbons	ES1502902-001	Anonymous	**Sum of PAHs**	----	23.1 %	0-20%	**RPD exceeds LOR based limits**
Laboratory Control Spike (LCS) Recoveries							
EP090: Organotin Compounds	4602229-002	----	**Monobutyltin**	78763-54-9	149 %	36-128%	**Recovery greater than upper control limit**
EP090: Organotin Compounds	4604712-002	----	**Monobutyltin**	78763-54-9	149 %	36-128%	**Recovery greater than upper control limit**
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1502737-001	WB3 0.5-1.0a	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

- **For all matrices, no Method Blank value outliers occur.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP090S: Organotin Surrogate	ES1502737-009	DUPLICATE 2A	**Tripropyltin**	----	158 %	35-130 %	**Recovery greater than upper data quality objective**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **EP090: Sample 'PC5 0.5-1.0A' shows poor matrix spike recovery for Monobutyltin due to matrix interference.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EP132B: Polynuclear Aromatic Hydrocarbons	ES1502902-001	PC5 0.0-0.5A	**Sum of PAHs**	----	23.1 %	0-20%	**RPD exceeds LOR based limits**
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1502902-001	PC5 0.0-0.5A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP090: Organotin Compounds	ES1502902-002	PC5 0.5-1.0A	**Monobutyltin**	78763-54-9	23.5 %	35-130%	**Recovery less than lower data quality objective**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Laboratory Control outliers occur.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP080-SD: TPH(V)/BTEX Surrogates	ES1502902-005	PC5 0.3V	**4-Bromofluorobenzene**	460-00-4	72.8 %	73-137 %	**Recovery less than lower data quality objective**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- **No Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- **No Quality Control Sample Frequency Outliers exist.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**
- **EA150H: Soil Particle Density as required for Hydrometer analysis according to AS 1289.3.6.3 2003 was unable to be performed on samples #031, #032, #037, #047 and #052 as insufficient sample was supplied by the client. Typical SPD values used for calculations and consequently NATA endorsement does not apply to hydrometer results.**
- **EP090: Sample 'PC6 0.0-0.5A' shows poor matrix spike recovery for Monobutyltin due to matrix interference.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Project	: GPC GEOCHEMICAL INVESTIGATION	QC Level	: NEPM 2013 Schedule B(3) and ALS QCS3 requirement
Site	: ----		
C-O-C number	: ----	Date Samples Received	: 10-FEB-2015
Sampler	: GK	Issue Date	: 27-FEB-2015
Order number	: 245553		
		No. of samples received	: 59
Quote number	: SY/1021/14 V2	No. of samples analysed	: 59

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics
Dilani Fernando	Senior Inorganic Chemist	Melbourne Inorganics
Eric Chau	Metals Team Leader	Melbourne Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Inorganics

Ryan Story	2IC Organic Instrument Chemist	Brisbane Organics
Satishkumar Trivedi	2 IC Acid Sulfate Soils Supervisor	Brisbane Acid Sulphate Soils
Shobhna Chandra	Metals Coordinator	Sydney Inorganics

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Site	: ----		
C-O-C number	: ----	Date Samples Received	: 10-FEB-2015
Sampler	: GK	Issue Date	: 27-FEB-2015
Order number	: 245553		
		No. of samples received	: 59
Quote number	: SY/1021/14 V2	No. of samples analysed	: 59

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1503000-001	PC6 0.5-1.0A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP090: Organotin Compounds	ES1503000-002	PC6 0.0-0.5A	**Monobutyltin**	78763-54-9	10.0 %	35-130%	**Recovery less than lower data quality objective**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Duplicate outliers occur.**
- **For all matrices, no Laboratory Control outliers occur.**

Regular Sample Surrogates

- **For all regular sample matrices, no surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

Matrix: **WATER**

Method / Container / Client Sample ID(s)	Extraction / Preparation			Analysis		
	Date extracted	Due for extraction	Days overdue	Date analysed	Due for analysis	Days overdue
EK057G: Nitrite as N by Discrete Analyser						
Clear Plastic Bottle - Natural						
RINSATE 3	----	----	----	11-FEB-2015	10-FEB-2015	**1**

Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- **No Quality Control Sample Frequency Outliers exist.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1503080-014	WB10 0.0-0.5A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EK255A SD: Ammonia in Sediment	ES1502850-041	Anonymous	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Duplicate outliers occur.**
- **For all matrices, no Laboratory Control outliers occur.**

Regular Sample Surrogates

- **For all regular sample matrices, no surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

Matrix: **SOIL**

Method / Container / Client Sample ID(s)	Extraction / Preparation: Date extracted	Extraction / Preparation: Due for extraction	Extraction / Preparation: Days overdue	Analysis: Date analysed	Analysis: Due for analysis	Analysis: Days overdue
EP080-SD / EP071-SD: Total Petroleum Hydrocarbons						
Soil Glass Jar - Unpreserved

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Dianne Blane	Laboratory Coordinator (2IC)	Newcastle - Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Inorganics

Ryan Story	2IC Organic Instrument Chemist	Brisbane Organics
Satishkumar Trivedi	2 IC Acid Sulfate Soils Supervisor	Brisbane Acid Sulphate Soils
Shobhna Chandra	Metals Coordinator	Sydney Inorganics
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)	Sample Date	Extraction / Preparation			Analysis

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Ammonia in Sediments	EK255A SD	2	18	11.1	10.0	✓	NEPM 2013 Schedule B(3) and ALS QCS3 requirement

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1503080-014	Anonymous	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Duplicate outliers occur.**
- **For all matrices, no Laboratory Control outliers occur.**

Regular Sample Surrogates

- **For all regular sample matrices, no surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- **No Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- **No Quality Control Sample Frequency Outliers exist.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **EA150H: Soil Particle Density as required for Hydrometer analysis according to AS 1289.3.6.3 2003 was unable to be performed on samples #046 and #052 as insufficient sample was supplied by the client. Typical SPD values used for calculations and consequently NATA endorsement does not apply to hydrometer results.**
- **EK067G:Poor duplicate precision due to sample heterogeneity. Confirmed by re-extraction and re-analysis.**
- **EP080-SD:Poor surrogate recovery due to sample matrix. Confirmed by re-extraction and re-analysis.**
- **EP090: Sample 'TRIPLICATE 8B' shows poor matrix spike recovery due to matrix interference. Insufficient sample for re-extraction and re-analysis.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.
