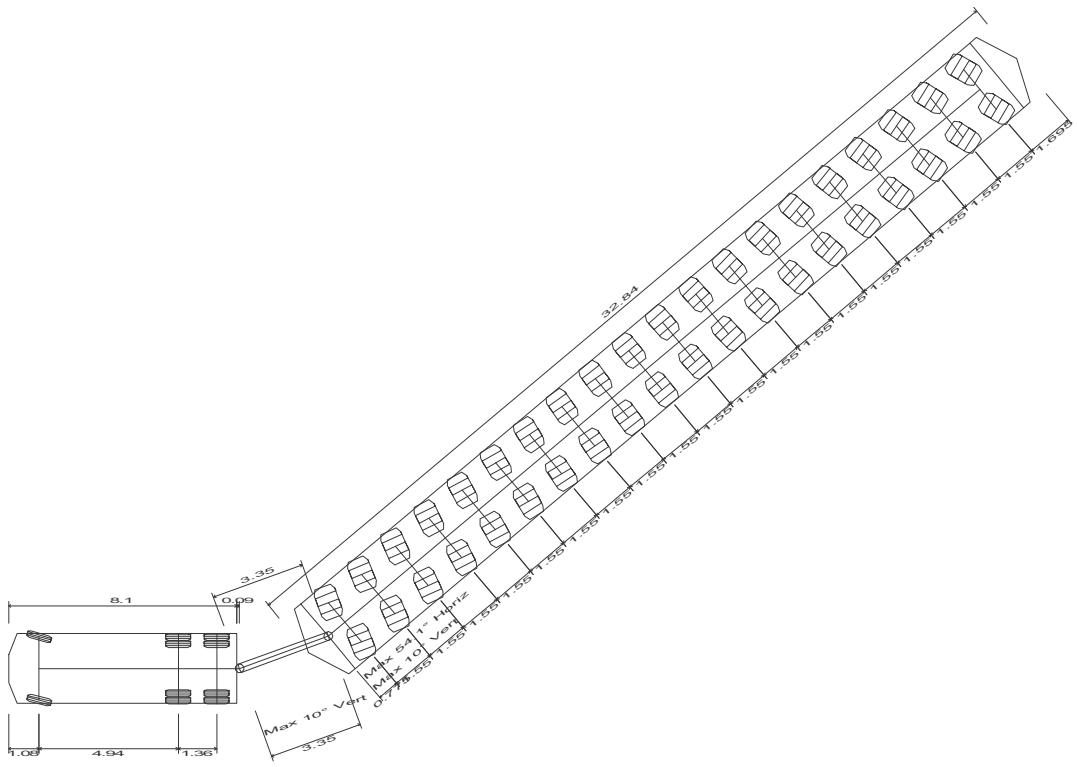
Vehicle Tracking Vehicle Details Ref: 100019

Vehicle Name:	**Modified Nicolas 20 Row (2 File)**
Type:	Articulated vehicle
Category	(Unspecified)
Classification	(Unspecified)
Source:	No data
Description:	No data
Notes:	No data
Unit 1 Name:	Modified Nicolas 20 Row (2 File) Tractor
Unit 2 Name:	Modified Nicolas 20 Row (2 File) Trailer 1
Unit 3 Name:	Modified Nicolas 20 Row (2 File) Trailer 2



Modified Nicolas 20 Row (2 File)	
Overall Length	43.460m
Overall Width	2.990m
Overall Body Height	3.341m
Min Body Ground Clearance	0.390m
Max Track Width	2.990m
Lock-to-lock time	6.00s
Wall to Wall Turning Radius	23.725m

Vehicle Tracking Vehicle Details Ref: 100019

Unit Name:	**Modified Nicolas 20 Row (2 File) Tractor**
Type:	Tractor (with driver controlled steering)
Body style:	Articulated Vehicle Tractor (Large)
Classification	(Unspecified)
Source:	No data
Description:	No data
Notes:	No data
Datum:	Front Primary Axle
Front Axle(s):	1 Ackerman (axles fixed, wheels turn)
Primary Front Axle Offset:	0.000m
Effective Front Axle Offset:	0.000m (Auto Calculated)
Maximum Wheel Angle:	Unlimited
Status:	Active Non Self-Steered
Track Width:	2.500m
Total Wheels:	2 (positioned at the ends of the axle)
Tire Width:	0.250m (Auto Calculated - proportion of Track Width)
Tire Diameter:	0.875m (Auto Calculated - proportion of Track Width)
Rear Axle(s):	2 Fixed (All axles identical)
Primary Rear Axle Offset:	4.940m (Innermost Axle behind Front Primary Axle)
Effective Rear Axle Offset:	5.620m (Auto Calculated)
Maximum Wheel Angle:	Unlimited
Rear Axle Spacing:	1.360m
Status:	Active Non Self-Steered
Track Width:	2.500m
Total Wheels:	4 (positioned at the ends of the axle)
Tire Width:	0.250m (Auto Calculated - proportion of Track Width)
Tire Diameter:	0.875m (Auto Calculated - proportion of Track Width)
Steering:	Front Axle(s):
Min. Wall / Wall Turning Radius:	23.725m (based upon body only)
Calculated Maximum Wheel Angle:	15.300deg
Lock-to-Lock Time (Fwd/Rev):	6.0sec / 6.0sec
Driver / Pilot	
Driver Offset Longitudinally:	0.420m (in front of Front Primary Axle)
Driver / Pilot Offset Laterally:	-0.600m (Right of Centerline)
Driver Height:	2.200m (Above ground level)
Front Coupling:	None
Rear Coupling:	Generic
Coupling Offset:	7.110m (behind Front Primary Axle)
Coupling Height:	0.438m (Auto Calculated - proportion of Tire Diameter)
Capability:	Can Tow or be Towed
Max. Horizontal Articulation Angle:	72.000deg
Max. Vertical Articulation Angle:	10.000deg
Body outline (plan):	
Outline Type:	Line
Offset (X,Y):	0.000m, 0.000m
Vertices...	
1	-1.080, 0.500
2	-0.780, 1.247

Vehicle Tracking Vehicle Details Ref: 100019

Unit Name:	**Modified Nicolas 20 Row (2 File) Trailer 1**
Type:	Towbar
Body style:	(Unspecified)
Classification	(Unspecified)
Source:	No data
Description:	No data
Notes:	No data
Datum:	Front Coupling
Maximum Articulation Angle:	72deg (to previous unit)
Front Axle(s):	None
Rear Axle(s):	None
Front Coupling:	Generic
Coupling Offset:	0.000m (in front of Front Coupling)
Coupling Height:	0.000m (Auto Calculated - proportion of Tire Diameter)
Capability:	Can Tow or be Towed
Max. Horizontal Articulation Angle:	0.000deg
Max. Vertical Articulation Angle:	10.000deg
Rear Coupling:	Generic
Coupling Offset:	3.350m (behind Front Coupling)
Coupling Height:	0.000m (Auto Calculated - proportion of Tire Diameter)
Capability:	Can Tow or be Towed
Max. Horizontal Articulation Angle:	49.200deg
Max. Vertical Articulation Angle:	10.000deg
Body outline (plan):	
Outline Type:	Rectangle
Offset (X,Y):	0.000m, 0.000m
Length / Width:	3.350m / 0.300m

Every Effort Has Been Made To Ensure The Accuracy Of This Information
Please Check Data From Your Own Sources

Vehicle Tracking Vehicle Details Ref: 100019

Unit Name:	**Modified Nicolas 20 Row (2 File) Trailer 2**
Type:	Trailer (no driver-controlled steering)
Body style:	(Unspecified)
Classification	(Unspecified)
Source:	No data
Description:	No data
Notes:	No data
Datum:	Front Coupling
Maximum Articulation Angle:	54deg (to previous unit)
Front Axle(s):	None
Rear Axle(s):	20 Ackerman (axles fixed, wheels turn) (Axles vary)
Primary Rear Axle Offset:	0.775m (Innermost Axle behind Front Coupling)
Effective Rear Axle Offset:	30.225m (Auto Calculated)
Maximum Wheel Angle:	55.000deg (Any Rear Wheel)
Linkage:	Rear axles linked to front axles
Basis	Angle of rear wheels
Rule 1:	Forward and reverse from 0.00deg, 94.90 based upon Tangents
Rear Axle 1	
Status:	Active Non Self-Steered
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m
Rear Axle 2	
Status:	Active Non Self-Steered
Axle Offset:	1.550m (behind Axle 1)
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m
Rear Axle 3	
Status:	Active Non Self-Steered
Axle Offset:	3.100m (behind Axle 1)
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m
Rear Axle 4	
Status:	Active Non Self-Steered
Axle Offset:	4.650m (behind Axle 1)
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m
Rear Axle 5	
Status:	Active Non Self-Steered
Axle Offset:	6.200m (behind Axle 1)
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m
Rear Axle 6	
Status:	Active Non Self-Steered

Axle Offset:	26.350m (behind Axle 1)
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m
Rear Axle 19	
Status:	Active Non Self-Steered
Axle Offset:	27.900m (behind Axle 1)
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m
Rear Axle 20	
Status:	Active Non Self-Steered
Axle Offset:	29.450m (behind Axle 1)
Track Width:	2.990m
Total Wheels:	2 (evenly spaced along the axle)
Tire Width:	1.170m
Tire Diameter:	0.780m

Front Coupling:	Generic
Coupling Offset:	0.000m (in front of Front Coupling)
Coupling Height:	0.390m (Auto Calculated - proportion of Tire Diameter)
Capability:	Can Tow or be Towed
Max. Horizontal Articulation Angle:	54.200deg
Max. Vertical Articulation Angle:	10.000deg

Rear Coupling:	None

Body outline (plan):	
Outline Type:	Rectangle
Offset (X,Y):	0.000m, 0.000m
Length / Width:	31.000m / 2.990m
Outline Type:	Line

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

DRAFT

1 Introduction

1.1 Project overview

This assessment has been undertaken to investigate the impact of the Inland Rail Northern Civil Works Program Border to Gowrie (IR B2G) on the road network in and around Brookstead. Brookstead is a rural town located approximately 55km south-west of Toowoomba and has several silos which generate heavy vehicle movements.

A locality plan detailing existing and proposed features is shown below in Figure 1.

The current IR design proposes a grade separated road crossing over the rail line at the current Gore Highway / Ware Street / Saal Road intersection (Interface ID 310-44-E-2), and a realignment of Saal Road to move the intersection with Gore Highway. Appendix A shows the current design proposal.

This traffic impact assessment builds upon the previous Environmental Impact Statement (EIS) for the B2G project. The EIS included the proposed detours, and this report does significantly change the previously presented information. Further discussions with relevant stakeholders (such as the local community, school, Translink, and GrainCorp) will occur at a later stage of the project.

Figure 1 Traffic impact assessment area

1.2 Reconfiguration options

There are two reconfiguration options being considered within this assessment, shown in Figure 2 and Figure 3.

Reconfiguration option 1 (Figure 2)

- Gore Highway / Saal Road / Ware Street intersection is removed.
- Gore Highway through movement provided via grade separation (road over rail).
- Saal Road and Ware Street connected via underpass adjacent to the rail corridor.
- Gore Highway access to/from Saal Road relocated west of existing intersection location and connected via a service road to Saal Road via a left-in left-out (LILO) access at the Gore Highway.
- Proposed Saal Road / Ware Street / Service Road all movements intersection.

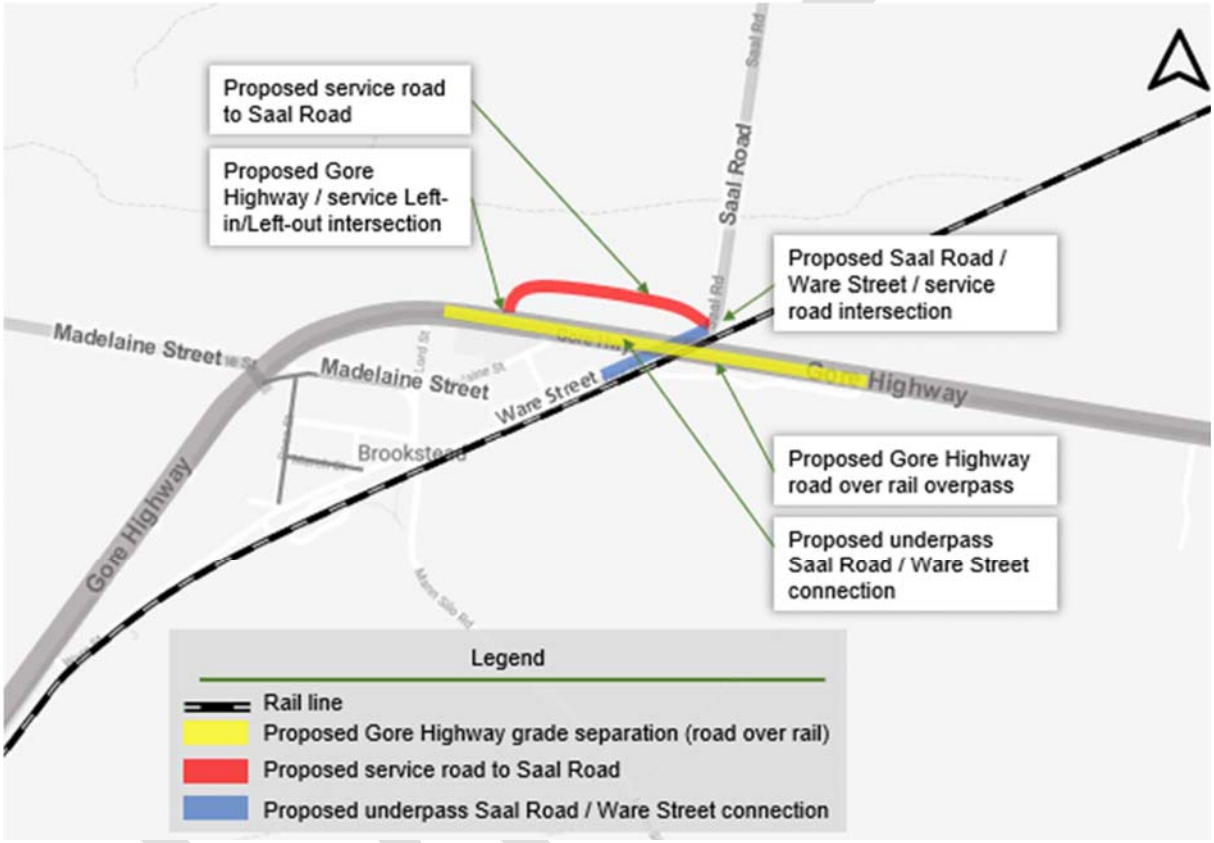

Figure 2 Reconfiguration option 1

Reconfiguration option 2 (Figure 3)

- Gore Highway / Saal Road / Ware Street intersection is removed.
- Gore Highway through movement provided via grade separation (road over rail).
- Saal Road and Ware Street connected via underpass adjacent to the rail corridor.
- Gore Highway access to/from Saal Road relocated west of existing intersection location and connected via a service road to Saal Road via a left-in access at the Gore Highway.
- Proposed Saal Road / Ware Street / Service Road intersection, with left and right turns out of the Service Road, and through movements on Saal Road and Ware Street only. This is a one-way service road, and no access onto the Gore Highway is provided.

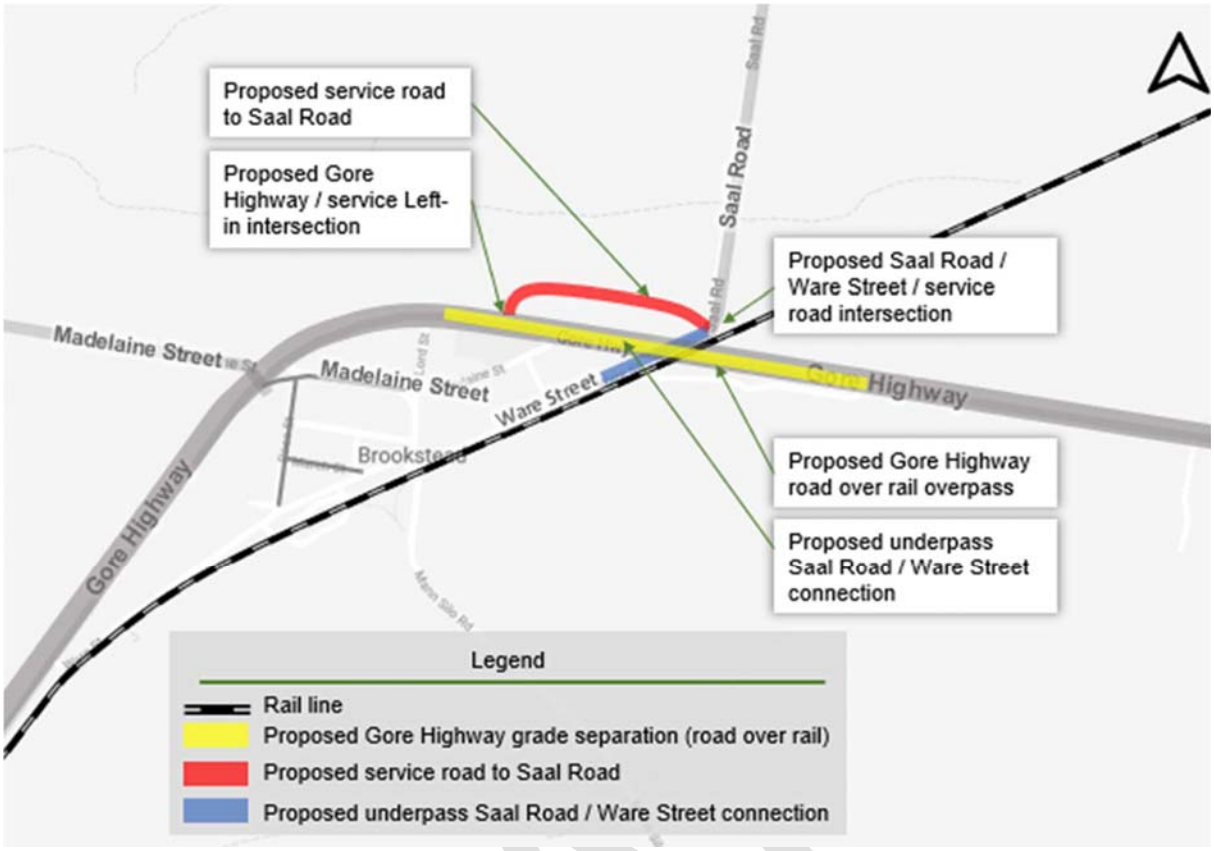

Figure 3 Reconfiguration option 2

1.3 Scope of assessment

This report documents the traffic impact assessment (TIA) of the proposed network modification options, considering safety and capacity of the local and state road networks. The scope of the assessment has focused on changes to operational aspects including:

- Access and frontage,
- Road link capacity,
- Intersection delay,
- Transport infrastructure, and
- Road safety.

This assessment is pursuant to Department of Transport and Main Roads (TMR) Guideline to Traffic Impact Assessment (GTIA) requirements for an EIS level desktop assessment.

1.4 Data sources

In undertaking this TIA, the following sources of data have been referenced:

- Traffic Surveys conducted from Monday 8 to Sunday 21 March 2021 (Austraffic)
  - Gore Highway / Madelaine Street North
  - Gore Highway / Madelaine Street South
  - Gore Highway / Ware Street / Saal Road
  - Gore Highway / Ware Street

1.5 Standards and guidelines

Table 1 summarises the key guidelines which have been referenced in the following report.

Table 1 Standards and guidelines used within this report

Standards and Guidelines	Details
TMR GTIA	The GTIA provides guidance to stakeholders involved in development that can potentially impact on the safety, efficiency, or infrastructure condition of the State-controlled road network in Queensland. It outlines the principles and the framework for undertaking a traffic impact assessment and provides advice on mitigation strategies to address traffic impacts.
TMR State Development and Assessment Provisions State Code 1 – Development in a State-controlled road environment	The purpose of this code is to protect the safety, function and efficiency of state-controlled roads, future state-controlled roads, road transport infrastructure, active transport infrastructure and public passenger services on state-controlled roads from adverse impacts of development.
TMR State Development and Assessment Provisions State Code 6 – Protection of State Transport Networks	The purpose of this code is to protect state transport infrastructure, public passenger transport infrastructure, active transport infrastructure and public passenger services from the adverse impacts of development, maintain the operating performance of the transport network, and ensure development enables safe and convenient access to public passenger transport.
Road design guidelines and manuals	Various sections of the Austroads Road Design and Road Safety Guides, Guide to Traffic Management, and the TMR Road Planning and Design Manual (RPDM).
Minimum Technical Requirements (MTR)	The Project MTR pertaining to minimum technical requirements for design elements.

1.6 Disclaimer

The analysis in this report has been prepared with due care but is subject to a number of assumptions which are outlined in the relevant sections, based upon information available at the time of writing this report.

The review and assessment are based on information provided to FFJV by other parties. FFJV has not independently verified this information and does not accept responsibility or liability for any inaccuracies or shortcomings in this information. Should these information sources be modified by these third parties, FFJV assumes no responsibility for any resulting inaccuracies in its information. The review and assessment are provided strictly on the basis that the information that has been provided is accurate, complete, and adequate.

In particular, the sight distance assessments has limited accuracy due to the desktop nature and these assessments should be revisited when further detailed survey is available in the future.

The crash assessment only considers crashes that have been recorded in the TMR register. Crashes of lower severity such as property damage and minor injury tend to be less accurately reported on and may be underrepresented.

Vertical clearance and structural condition of any structures along detour routes has not been assessed due to the limited accuracy from the desktop assessment.

The contents of this report must not be relied upon for design, construction, costing, or programming purposes.

2 Existing conditions

2.1 Planning context

2.1.1 Land use and zoning

Figure 4 shows the area immediately surrounding the proposed grade-separated crossing is currently zoned as a combination of rural, township, and mixed use under the Toowoomba Regional Planning Scheme (2017).

Figure 5 shows the Toowoomba Regional Planning Scheme (2017) priority infrastructure development areas.

A search of Toowoomba Regional Council (TRC) Property Development Application portal (PD Online) returns no in process or approved applications that are impacted by the proposed road upgrades.

ARTC has been talking to GrainCorp in to understand their traffic flow and access requirements for their site on Ware Street. Within this impact assessment for Inland Rail, additional traffic volume for development within Brookstead is captured within the growth of background traffic. GrainCorp impacts should be assessed by the authorities as part of due process for their development application.

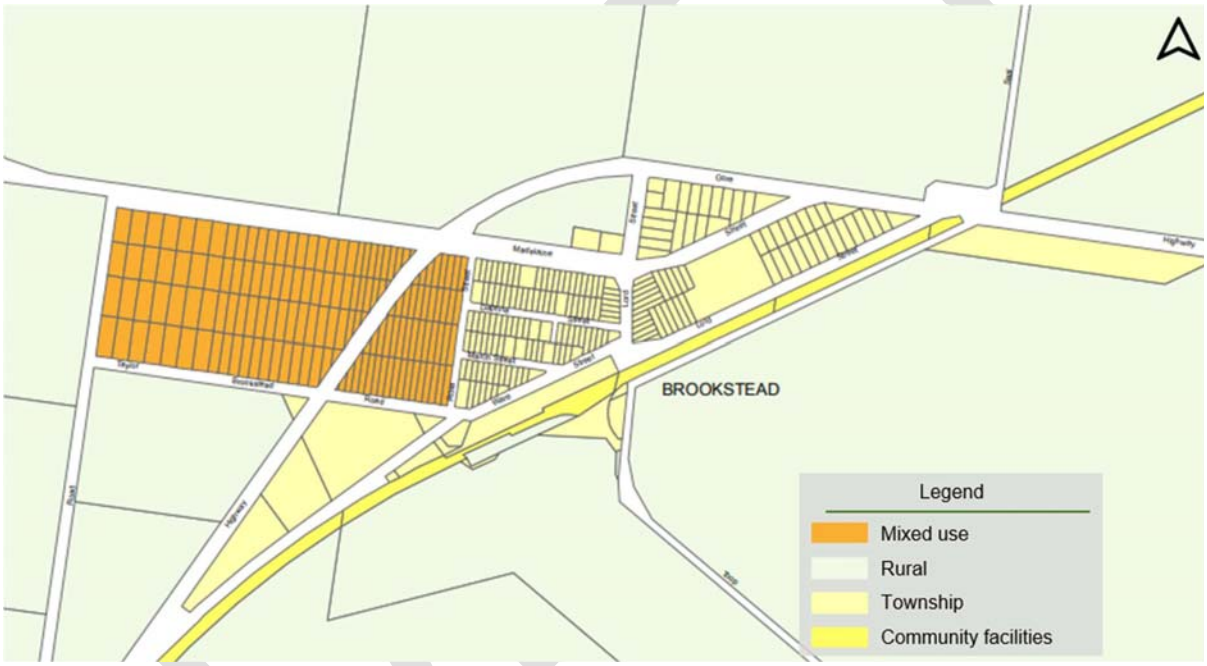

Figure 4 Current Brookstead land use zoning (Toowoomba Regional Planning Scheme, 2017)

Figure 5 Current Brookstead local government infrastructure planning categories (Toowoomba Regional Planning Scheme, 2017)

2.2 Existing road network

2.2.1 Surrounding roads

The proposed grade separated crossing site is located along the Gore Highway, a national highway and freight route for road train class vehicles linking Toowoomba to Goondiwindi. The key roads that form the network adjacent to the site range from a combination of district and local roads including Saal Road, Madelaine Street and Ware Street. The road hierarchy for the Project area is shown in Figure 6 below, and a discussion of the characteristics of the key roads in the network is provided in Table 2.

Figure 6 Surrounding road network

DRAFT

Table 2 Key characteristics of the external road network

Road Name	Control	Function	Footpath / Cycling provision	Cross Section	Pavement Condition	Two-Way Daily Volume (Source)	Posted Speed
Gore Highway	TMR	National Road Network Highway and (road train) freight route connecting Queensland's major Regional Centres	No dedicated on-road cycle lanes or pedestrian footpath	1 lane in each direction, undivided, with 2m line marked shoulder	Sealed	2,947 (2019 AADT)	100km/h (MTR)
Madelaine Street (North and West of Gore Highway intersection A2)	TMR	State District Road and (B-double) freight route Madelaine Street connects Brookstead to Regional Centres to the North-West	No dedicated on-road cycle lanes or pedestrian footpath	1 lane in each direction, undivided, line marked	Sealed	170 (2019 AADT)	100km/h (MTR) (40km/h on approach to intersection)
Madelaine Street (South and East of Gore Highway intersection A1)	TRC	Local Road and (B-double) freight route within Brookstead centre.	No dedicated on-road cycle lanes or pedestrian footpath	1 lane in each direction, undivided, no line marking	Sealed	97 (2021 ATC)	60km/h (posted)
Ware Street (southern connection, East of Gore Highway)	TRC	Local access for commercial, residential, and school land uses	No dedicated on-road cycle lanes or pedestrian footpath	1 lane in each direction, undivided, no line marking	Sealed	118 (2021 ATC)	60km/h (posted) (with 40km/h school zone)
Ware Street (South of Gore Highway, across from Saal Road)	TRC	Local access for commercial, residential, and school land uses	No dedicated on-road cycle lanes or pedestrian footpath	1 lane in each direction, undivided, no line marking	Sealed	246 (2021 ATC)	60km/h (posted) (with 40km/h school zone)
Saal Road (North of Gore Highway, across from Ware Street)	TRC	Local Road and (B-double) freight route connecting Brookstead to Regional Centres	No dedicated on-road cycle lanes or pedestrian footpath	1 lane in each direction, undivided, no line marking	Sealed	68 (2021 ATC)	60km/h (posted) (40km/h at bend)
Lord Street	TRC	Local access for commercial and residential land uses	No dedicated on-road cycle lanes or pedestrian footpath	1 lane in each direction, undivided, no line marking	Sealed	151 (2021 ATC)	60km/h (posted)

Note: This table describes traffic volumes sourced from either 2019 AADT data, or 2021 automatic tube count (ATC) 10 (week) days average from March 2021. The traffic volumes are built using intersection survey data (and then conservatively factored up with traffic growth and seasonal variation factors), therefore there is a difference between this table and others within this report.

The approved heavy vehicle routes in proximity to the study area are as shown in Figure 7. As shown in this figure, the Gore Highway is a key strategic RT1 road train heavy vehicle route, with several fronting roads approved for 25m B-double combination vehicles and/or Higher Mass Limit (HML) vehicles.

Figure 7 Approved heavy vehicle routes

2.2.2 Key intersections

The intersections which have been determined to be impacted by the proposed grade-separated level crossing (i.e., intersections directly impacted by closed turns and those with rerouted vehicle movements as a result of the closed turns) are as follows:

- **Intersection A1:** Gore Highway / Madelaine Street North, a priority (stop-sign) controlled T-intersection
- **Intersection A2:** Gore Highway / Madelaine Street South, a priority (give-way) controlled T-intersection
- **Intersection B:** Gore Highway / Ware Street / Saal Road, a priority (give-way at Saal Road and stop-sign at Ware Street) controlled 4-way intersection
- **Intersection C:** Gore Highway / Ware Street, a priority (give-way) controlled T-intersection
- **Intersection D:** Ware Street / Lord Street, a priority (give-way) controlled 4-way intersection.

The above intersections are identified in Figure 8 below.

DRAFT

Figure 8 Project intersections

Traffic volumes have been developed using three sets of count data (refer Section 1.4). These traffic counts informed the traffic analysis undertaken to determine future network movements brought on by the proposed grade-separated level crossing. The survey dates were selected to coincide with the harvest period and school term in Brookstead to capture the existing peak period volumes in the area.

For existing typical 24-hour. AM and PM peak hour traffic volumes refer to Appendix B.

DRAFT

2.2.3 Crash statistics

An investigation into the crash history of the road network surrounding the proposed grade-separated crossing location was conducted to uncover trends and identify risks in the network. Historical vehicle crash data over the last 10 years (2012 – 2021 inclusive) was collected via the Queensland Government Open Data Portal (2022).

A summary of the vehicle crash locations by 'definition for classifying accident' (DCA) severity recorded over the last 10 years between 2012 and 2021 is provided in Figure 9. The breakdown of vehicle crashes by location and crash type from 2012 to 2021 is summarised in Table 3. As shown in this figure and table, there have been a total of 13 crashes recorded on the Gore Highway segment over the 10-year period, with 6 of the 10 crashes run off road crashes.

An assessment of contributing factors identifies the majority of crashes have occurred in dry weather, 60% of crashes occurred in daylight, versus 40% in un-lit darkness, and every crash has a recorded speed of 100-110km/h. This identifies that speed may be a contributing factor to the crashes.

From the crash analysis, we have identified a cluster of crashes on the Gore Highway, in a curved, un-lit segment with no immediate intersections, but a single property access.

Figure 9 Crash locations

Table 3 Crash type breakdown 2012 – 2020 (Source: Queensland Government Open Data)

Crash Type	Fatal	Hospitalisation	Medical treatment	Minor injury	Total
Off Path-Curve: Off Carriageway Right Bend		2	1		3
Off Path-Curve: Off Carriageway Left Bend		1	2		3
Vehicles Opposite Approach: Head On	1		1		2
Off Path-Curve: Off Carriageway Lt Bend Hit Object			1		1
Off Path-Straight: Out of Control on Carriageway		1			1
Vehicles Overtaking: Other				1	1
Off Path-Straight: Right Off Carriageway			1		1
Off Path-Curve: Out of Control on Carriageway		1			1
Total	**1**	**5**	**6**	**1**	**13**

Note that this assessment considers only crashes that have been recorded in the TMR register. Crashes of lower severity such as property damage and minor injury historically tend to be less accurately reported on and may be underrepresented in this assessment.

2.2.4 Planned infrastructure upgrades

A review of Toowoomba Regional Council's Local Government Infrastructure Plan (LGIP) has been undertaken and no future infrastructure appears to be planned along the Gore Highway, or in close proximity to the proposed grade separated crossing site.

A review of TMR's Queensland Transport and Roads Investment Program 2022-23 to 2025-26 (QTRIP) lists a $45,500 investment for road upgrades along the "Gore Highway (Toowoomba – Goondiwindi), various locations" and the Queensland Government Development Assessment Mapping System found 1 future infrastructure plan for the State-controlled road (SCR) network in close proximity to the site; this being a ~2.5km segment of the Gore Highway approximately 500m east of the existing open level crossing as shown in Figure 10 below. QTRIP lists this as a pavement rehabilitation investment upgrade and future overtaking lane project.

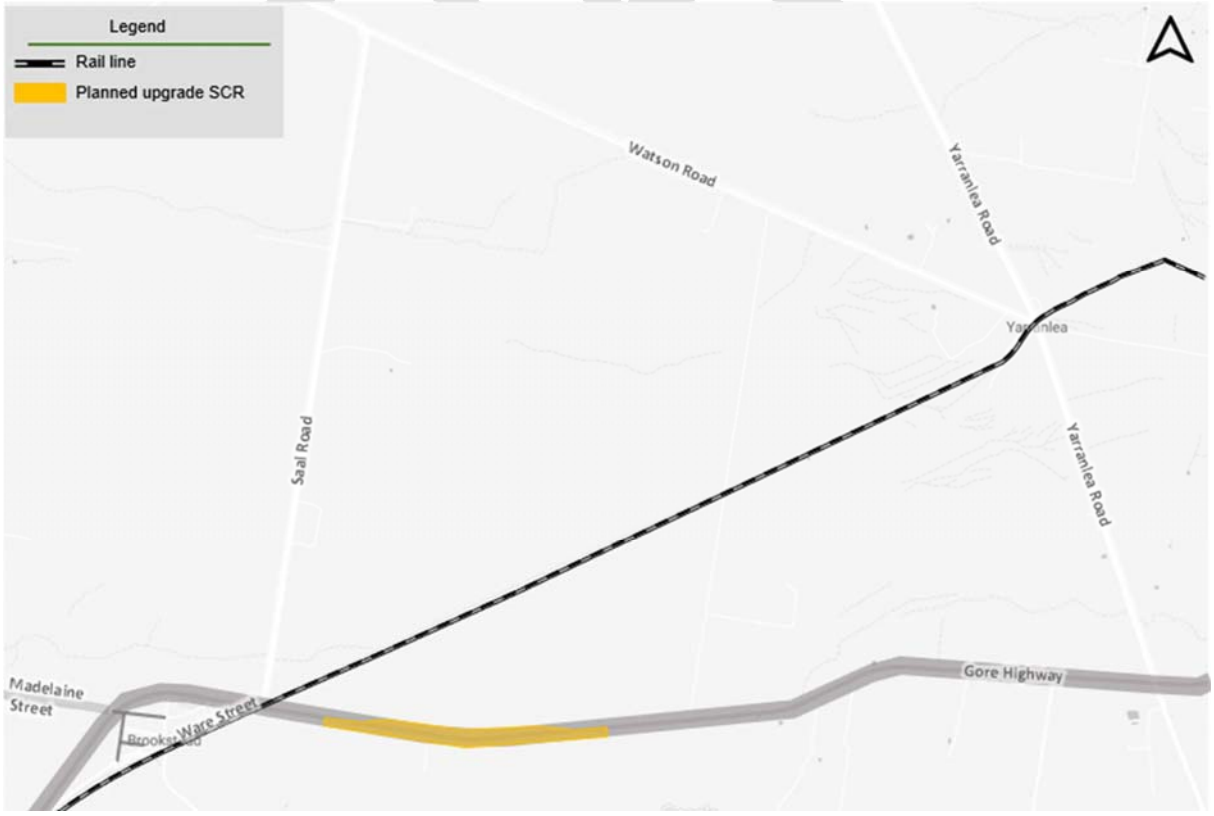

Figure 10 Planned upgrades for state – controlled road (Queensland government development assessment mapping system)

2.2.5 Existing traffic data sources

The existing traffic volumes referenced in this assessment are sourced from a 24-hour classified traffic count survey conducted by Austraffic at the key intersection locations identified in Figure 8 as well as at other local road segments within and surrounding Brookstead to assist with the rerouting analysis as follows:

- Gore Highway / Madelaine Street North
- Gore Highway / Madelaine Street South
- Gore Highway / Ware Street / Saal Road
- Gore Highway / Ware Street
- Ware Street (northern connection) South of Gore Highway
- Gore Highway East of Ware Street
- Ware Street (southern connection) East of Gore Highway
- Lord Street between Daphne Street and Ware Street
- Ware Street between March Street and Lord Street
- Ware Street East of Lord Street
- Mann Silo Road South of Ware Street
- Gore Highway / Yarranlea Road
- Yarranlea Road / Watson Road

2.2.6 Peak period determination

The March 2021 count data was analysed to determine the peak AM and PM hours. Wednesday 10 March 2021 had the highest volumes and defined the peak hours as:

- **AM peak hour:** 11:00am to 12:00pm
- **PM peak hour**: 3:30pm to 4:30pm

There are some differences from the overall peak time periods across the network, however the volume differences are very small, therefore no adjustment has been required.

The AM Peak period has been assessed as the 'worst peak' due to the higher heavy vehicle volumes. Light vehicle volumes are similar between peaks.

2.2.7 Traffic growth rate

A yearly compound growth rate of 2.0% has been assumed for all traffic volumes as agreed upon previously with ARTC. It is also roughly in line with historical AADT data collected on the Gore Highway closest to the project from 2015-2019 (QLD Open Data Portal).

A separate seasonal factor of 1.18 has been applied, in line with the wider B2G EIS assessment. No separate factor for COVID updates has been applied as the background growth and seasonal factor application are considered sufficient.

2.2.8 Opening year

The opening year of the project is assumed to be 2028, with a 10-year design horizon of 2038.

2.2.9 Background traffic volumes

The existing classified background traffic counts for each intersection by typical weekday 24-hour period, AM peak hour and PM peak hour have been summarised in Appendix B.

DRAFT

2.2.10 Existing intersection layouts

Table 4 provides the existing intersection layouts used in the SIDRA assessment to provide context for turn movement descriptions.

This is a desktop assessment and further analysis is recommended to be undertaken during detailed design and construction road safety audits.

The existing formation of the intersections have not been reviewed as this assessment is to determine the impact of the proposed reconfiguration. And deficiencies in the arrangement are an existing issue and not required to be mitigated by the project.

Table 4 SIDRA intersection layouts

Intersection	Layout / Control Type
A1+A2: Gore Highway / Madelaine Street	 Note: Intersection A1 and A2 have been modelled together in SIDRA Network. The start of the Gore Highway right turn lanes display as a short through lane at each intersection, however this is just a display issue, and does not impact the assessment.

Intersection	Layout / Control Type
B: Gore Highway / Ware Street / Saal Road (Existing form, both reconfiguration options change this intersection)	C: Gore Highway / Ware Street	
2.3 Alternative transport modes

2.3.1 Public transport network

The study area is not serviced by any public transport routes.

There are 2 school service bus lines with routes that traverse Brookstead – the first passes through Brookstead via the Gore Highway with no diversions and the other follows a path to/from Madelaine St, Lord Street and Ware Street before linking up with the Gore Highway at the Gore Highway / Ware Street / Saal Road intersection as shown in Figure 11. Darling Downs Transit lists each of these routes as having 1 morning and afternoon school service running during the school term.

Figure 11 Proximity to public transport

2.3.2 Cycling network

No shared use paths or bicycle lanes are provided in the vicinity of the study area and there are no designated cycle networks within Brookstead covered in the TMR Downs South West Principal Cycle Network Plan (2021).

3 Proposal details

3.1 Reconfiguration options detour assessment

Reconfiguration option 1 and 2 are explained in Section 1.2, and Table 5 provides the detour assessment for both reconfiguration option 1 and 2 network changes.

It is important to note that there is no new traffic being created by this proposal, and all traffic is detoured traffic that currently uses the Gore Highway / Saal Road / Ware Street intersection, so overall volumes of traffic are not changing.

The resulting forecast background traffic volumes, trip distribution and development traffic volumes on the network within the opening year (2028) and design horizon (2038) are shown in the figures included as Appendix C and Appendix D.

Table 5 Detour Assumptions

Original movement	Reconfiguration option	Detour assumption	Discussion
Saal Road (Northern approach) – southbound right turn movement	**1**	Vehicles join through traffic onto Ware Street then travel through town to southern Gore Highway / Ware Street intersection. Vehicles then turn left from Ware Street to Gore Highway to continue travelling south. 	This detour allows vehicles to travel a similar distance with a similar travel time. There are a few destinations along the Gore Highway between Saal Road and Ware Street. Vehicles travelling to these locations would be able to access the local network by turning right at the Gore Highway / Ware Street intersection instead of southbound. Overall, there is minimal additional travel time due to the love volumes on the network.
	2	Same as reconfiguration option 1	

Saal Road (Northern approach) – southbound left turn movement	**1**	Vehicles approaching from the north will turn right onto the service road and then left onto the Gore Highway to travel to the east. 	This detour has been selected as it provides the most direct route to the Gore Highway. Overall, there is a very minor increase in both distance travelled and travel time.
	2	Vehicles approaching from the north will instead travel via Ware Street to Lord Street, onto Madelaine Street and then left onto the Gore Highway to travel to the east. 	Vehicles approaching from the north will continue along Ware Street and use Madelaine Street as a detour to access the Gore Highway. Overall, there is an increase in both distance travelled (~3km) and travel time (~2.5mins) due to the 60km/h speed on local streets. There is sufficient capacity within the local network to accommodate movements in any direction.

Gore Highway (Eastern approach) - westbound right turn movement	**1**	Vehicles will need to proceed to the Gore Highway / Madelaine Street intersection to turn left at the northern intersection. Vehicles will then travel through town and along Ware Street to reach Saal Road.  	This detour has been selected as it allows travellers to follow detour signage after the turn to Saal Road is not available. Overall, there is a minor increase in both distance travelled and travel time. Some vehicles may detour at the preceding Yarranlea Road intersection instead if it suits their destination, and would also be minimal impact on travel time.
	2	Same as reconfiguration option 1	
Gore Highway (Eastern approach) - westbound left turn movement	**1**	Vehicles will need to proceed to the Gore Highway / Madelaine Street intersection to turn left at the northern intersection. Vehicles will then travel to their destination within Brookstead township.  	Vehicles accessing Ware Street are likely travelling to local destinations within the township. Depending on exact destination vehicles are travelling to, vehicles will experience a minor increase in both distance travelled and travel time.
	2	Same as reconfiguration option 1	

Ware Street (Southern approach) – northbound right turn movement	**1**	Vehicles will travel straight from Ware Street to Saal Road and then turn onto the Service Road, and then turn left onto the Gore Highway to travel to the east.  	This detour has been selected as it allows travellers to follow detour signage after the turn to Saal Road is not available. Overall, there is a minor increase in both distance travelled and travel time. Some vehicles familiar with the network may detour via Madelaine Street if they are from the western end of Ware Street.
	2	 	Vehicles travelling from Ware Street are likely travelling from a local destination within the township. Overall, there is an increase in both distance travelled and travel time. There is sufficient capacity within the local network to accommodate movements in any direction.

Ware Street (Southern approach) – northbound left turn movement	**1**	Vehicles will travel from their location in town (likely the north-eastern section) to the southern Gore Highway / Ware Street intersection and complete a left turn to join the Gore Highway in the southern direction. 	Vehicles travelling from Ware Street are likely travelling from a local destination within the township. Depending on the destination vehicles are travelling to, vehicles will experience an increase in both distance travelled and travel time. There is sufficient capacity within the local network to accommodate movements in any direction.
	2	Same as reconfiguration option 1	
Gore Highway (Western approach) – eastbound right turn movement	**1**	Due to the low number of vehicles (2 vehicles/day), it is assumed these vehicles originate from the local property on the northern side of the Gore Highway. These vehicles will instead turn left onto the service road and then directly left onto the service road to gain access to Ware Street. 	These are likely to be local trips from property along Gore Highway. Depending on the destination vehicles are travelling to, vehicles will experience a minor increase in both distance travelled and travel time.
	2	Same as reconfiguration option 1	

Gore Highway (Western approach) - eastbound left turn movement	**1**	Vehicles will approach from the west along Gore Highway and then turn left onto the service road. From the service road, they can turn left to reach Saal Road.  	Vehicles travelling northbound on Saal Road are likely travelling from either the south (Gore Highway), or from the west (Madelaine Street). Local trips are likely to go north on Ware Street to access Saal Road, which is no change from existing travel patterns. Overall, there is a very minor increase in both distance (<100m) and travel time (<30 seconds).
	2	Same as reconfiguration option 1	

DRAFT

Table 6 and Table 7 show the intersection volumes for the Base Case, vs the Option using base case traffic volumes. If there is no change between base case and detour scenario, the movement has not been shown.

Volumes have been separated into three categories:

- Light vehicles (LV) which corresponds with Austroads class 1 and 2 vehicles,
- Heavy vehicles (HV) for class 3 to 9 vehicles, and
- Extra heavy vehicles (XHV) with class 10 to 12 vehicles.

The detour scenario traffic volumes and trip distributions are shown visually in Appendix B.

It is important to note that no additional traffic is created by this project, it is simply moving some trips from one movement at an intersection to another. This is why the overall vehicle increases are low. Of the detoured trips, many move from a higher risk movement (i.e., right turn from Ware Street onto the Gore Highway at Intersection B) to a lower risk movement (to the through movement).

Table 6 Rerouting 24-hour traffic volumes (from 2021 Count data) – Reconfiguration Option 1

The traffic volumes and corresponding peak hour volumes are being adopted for further assessments of turn warrants, link analysis, and capacity analysis in subsequent sections of this report.

4 Impact assessment and mitigation

The following report sections provide the following impact assessment and mitigation measures (if required):

- Section 5 Access and frontage assessment.
- Section 6 Road link capacity
- Section 7 Intersection delay
- Section 8 Transport infrastructure
- Section 8.2 Road safety

Note, as this report forms part of the EIS stage of the project, this report is a desktop assessment and does not assess the GTIA impact categories of construction traffic or pavement impacts as there is not sufficient detail to undertake this assessment at this stage. Both impact areas can be addressed in at the next stage where more detailed tasks can be undertaken such as site visits, road safety audits, and traffic management plans. This will enable further work to be undertaken to address comments from TMR about pavement maintenance requirements (noting that roads are generally sealed through Brookstead), and signage updates.

DRAFT

5 Access and frontage assessment

In the vicinity of the proposed works, common to both reconfiguration options, there are two private property driveways. These driveways are located where the crash cluster is observed (see Section 2.2.3).

Figure 12 shows the access to 5608 Gore Highway. The driveway appears to be the only access point to the homestead, which will require alternative access to be provided as the driveway will not be located at an appropriate point, and may cause additional risk to vehicles accessing Saal Road.

Figure 13, shows the access to 34 Lord Street from the Gore Highway. This is a classed “historic access” with no current or previous road access approval from TRC. However, the alternative gravel, unsealed driveway to 34 Lord Street is less desirable for heavy trucks frequenting the site. The proposed road over rail bridge will improve visibility and driver perception on the Gore Highway for traffic turning out of this property so there is no reason to remove this access arrangement.

Figure 12 5608 Gore Highway, Brookstead (Google Maps, 2022)

Figure 13 34 Lord Street, Brookstead (Google Maps, 2022)

In summary, the recommended mitigation measure is to work with the property owner of 5608 Gore Highway to integrate a driveway access into the proposed reconfiguration arrangement, either from the service road, or from Saal Road.

6 Road link capacity assessment

The TMR GTIA guidelines require a link capacity assessment be undertaken on all roads where the development traffic exceeds 5% of the opening year base volume, determined from the background traffic volume plots, derived from traffic count surveys as explained in Section 2.2.9.

Table 8 shows which links exceed 5% of the base traffic in either direction for the year of opening (2028). The traffic volume comparison plots showing links exceeding the 5% increase threshold for reconfiguration option 1 and reconfiguration option 2 are shown in Appendix C.

Table 8 Road link capacity assessment – base volume change

Road link	Extents	Does the 24-hour volume change exceed 5% of base traffic?	
		Reconfiguration option 1	Reconfiguration option 2
Gore Highway	Ware Street to Madelaine Street	No	No
	Madelaine Street to Saal Road	Yes (5.1%)	Yes (5.1%)
	Saal Road to Yarranlea Road	No	No
Ware Street	Gore Highway to Lord Street	Yes	Yes
	Lord Street to Saal Road	No	Yes
Madelaine Street	West of Gore Highway	No	Yes
	Gore Highway to Lord Street	Yes	Yes
Saal Road	Gore Highway to St Helens Road	Yes	Yes
Brookstead Scrubby Road	All	No	No

The next step of the road link capacity assessment for the identified links compares the delay based Level of Service (LOS) for any links that have a >5% daily volume change, to understand if the LOS changes for each option as shown in Table 9. The AGTM definitions for LOS for uninterrupted two-lane rural roads are shown in Figure 14.

Criteria	LOS				
	A	B	C	D	E
FFS = 120 km/h					
Maximum density (pc/km/ln)	7	11	16	22	28
Minimum speed (km/h)	120.0	120.0	114.6	99.6	85.7
Maximum (v/c)	0.35	0.55	0.77	0.92	1.00
Maximum service flow rate (pc/h/ln)	840	1320	1840	2200	2400
FFS = 110 km/h					
Maximum density (pc/km/ln)	7	11	16	22	28
Minimum speed (km/h)	110.0	110.0	108.5	97.2	83.9
Maximum (v/c)	0.33	0.51	0.74	0.91	1.00
Maximum service flow rate (pc/h/ln)	770	1210	1740	2135	2350
FFS = 100 km/h					
Maximum density (pc/km/ln)	7	11	16	22	28
Minimum speed (km/h)	100.0	100.0	100.0	93.8	82.1
Maximum (v/c)	0.30	0.48	0.70	0.90	1.00
Maximum service flow rate (pc/h/ln)	700	1100	1600	2065	2300
FFS = 90 km/h					
Maximum density (pc/km/ln)	7	11	16	22	28
Minimum speed (km/h)	90.0	90.0	90.0	89.1	80.4
Maximum (v/c)	0.28	0.44	0.64	0.87	1.00
Maximum service flow rate (pc/h/ln)	630	990	1440	1955	2250

Source: Adapted from Exhibit 23-2 in HCM 2000 and updated from Exhibit 12-15 in HCM 2016 (TRB 2016).

Figure 14 LOS definitions (AGTM Part 3 Transport Study and Analysis Methods)

In response to review comments from TRC, the LOS thresholds have been reduced by 10% to allow for pavement quality impacting on flow for local roads.

The highest one-way 2028 volume on a local road is calculated to be <300 vehicles per day. The highest Gore Highway one-way 2028 volume is calculated to be <3,000 vehicles per day.

All roads within the study area maintain LOS A and B through the base case, reconfiguration option 1 and reconfiguration option 2 scenarios. No changes to LOS are experienced on any segment of the state controlled or council networks. Therefore, the road link capacity assessment concludes no further mitigation measures are required for any road segment.

This is a desktop assessment and there are several factors such as pavement condition, seal and formation widths that contribute to level of service that are not able to be considered within a desktop study. Further analysis is recommended to be undertaken during detailed design and construction stages of the project.

Table 9 Road link capacity assessment – LOS assessment

Road link	Extents	Level of service			Does the LOS change?	
		Base	Reconfiguration option 1	Reconfiguration option 2	Reconfiguration option 1	Reconfiguration option 2
Gore Highway	Madelaine Street to Saal Road	A	A	A	No	No
Ware Street	Gore Highway to Lord Street	B	B	B	No	No
	Lord Street to Saal Road	B	B	B	No	No
Madelaine Street	West of Gore Highway	B	B	B	No	No
	Gore Highway to Lord Street	B	B	B	No	No
Saal Road	Gore Highway to St Helens Road	A	A	A	No	No

DRAFT

7 Intersection assessment

7.1 SIDRA parameters

Key SIDRA parameters adopted for measuring intersection performance, include the following:

- **Degree of Saturation (DoS)** - Degree of saturation (DoS) is defined as the ratio of demand to capacity of a given intersection. A DoS of 1.0 indicates the intersection is at full capacity, and above 1.0 is oversaturated, resulting in long queues and delays. In practice, a DoS of 1.0 would result in unstable flows, therefore there is a practical DoS which represents the target maximum saturation. The maximum target DoS for signalised intersections is 0.90, and for an unsignalised intersection is 0.80.
- **Average Delay** - The delay time, in seconds, which can be expected over all vehicles making a particular movement in the peak hour. More than 70 seconds of delay on a movement equates to a Level of Service of F and usually indicates severely congested conditions, while delays of 0 – 28 seconds represent good operation and delays of 43 – 56 seconds suggest operation near capacity, depending upon the nature of the movement and the intersection control.
- **Level of Service (LOS)** - An index of the operational performance, based upon delays, measured on an A to F scale, with LOS A representing the best operating conditions and LOS F the worst.
- **95th Percentile Queue** - The maximum queue length, in metres, that can be expected in 95% of observed queue lengths in the peak hour. In other words, only 5% of queues during the peak hour will exceed this queue. The acceptability of this length varies according to site conditions but as a minimum it is important to at least achieve sight distance to the back of queue to avoid a safety risk.

Where there is no peak hour traffic volume for a particular movement, SIDRA intersection turn movements have been increased to be at least 1 light vehicle per hour, to meet program requirements.

7.2 Delay assessment

The following section of this report summarises the results of the capacity analyses undertaken of the subject intersections, considering the above intersection performance parameters.

The project intersections have been assessed at the year of opening (2028) of the proposed development in accordance with the procedure outlined in the TMR GTIA document, as summarised in the following:

- Each intersection that has any >5% turn movement volume increases has been analysed for the base case, reconfiguration option 1 and reconfiguration option 2 layouts to determine the movement delays. Refer Figure 8 for intersection identification.
- Total vehicle -minutes across each intersection and scenario have been calculated, to determine the development impact in accordance with the aggregate intersection delay impact vehicle minutes formula. Where development traffic adds less than 5% of delay to the base case traffic aggregate, no mitigation to treat the intersection delay is required.
  - With development intersection vehicle minutes is calculated by multiplying the ‘with development’ scenario average delay by movement, by the base case volume for each movement. This purposely does not count the impact as delays to development traffic, only to pre-existing traffic that is affected by the additional delays.
  - Base case intersection vehicle minutes is calculated by multiplying the base case average delay by movement by the bas case volume for each movement.
- Identify any intersection upgrades if required to mitigate intersection delay.

A SIDRA intersection 9.0 performance assessment has been carried out for each of these intersections under year of opening (2028) and 10-year design horizon (2038) peak hour conditions to confirm that they will operate within acceptable capacity limits with the additional traffic forecast to be generated by the proposed development, in accordance with standard practice.

DRAFT

Table 10 provides a summary of the aggregate intersection delay calculations for year of opening, and whether the intersection exceeds 5% of additional delay. There are no increases in delay for pre-existing traffic under reconfiguration option 1 or reconfiguration option 2. The aggregate delay across all intersections is less than 5% therefore no mitigation works are required.

Table 10 Summary of 2028 aggregate intersection delay calculations

Intersection	Peak	Base (vehicle minutes)	Reconfiguration option 1		Reconfiguration option 2	
			Vehicle minutes	Increase from base (%)	Vehicle minutes	Increase from base (%)
A1: Gore Highway / Madelaine Street North	AM	1 min 34s	1 min 33s	-1%	1 min 35s	1%
	PM	1 min 47s	1 min 46s	-1%	1 min 50s	2%
A2: Gore Highway / Madelaine Street South	AM	1 min 49s	1 min 47s	-1%	1 min 47s	-1%
	PM	2 min 50s	2 min 47s	-2%	2 min 47s	-2%
B: Gore Highway / Ware Street / Saal Road	AM	5 min	33s	-89%	16s	-95%
	PM	5 min37s	28s	-92%	16s	-95%
C: Gore Highway / Ware Street	AM	1 min 25s	1 min 24s	-1%	1 min 24s	-1%
	PM	3 min 31s	3 min 31s	0%	3 min 31s	0%
D: Ware Street / Lord Street	AM	3 min 46s	3 min 46s	0%	3 min 50s	2%
	PM	2 min 59s	2 min 59s	0%	3 min 1s	1%
Total		30 min 16s	20 min 33s	-32%	20min 17s	-33%

Note: Intersection B has decreased delay in the options compared to the base case due to the closure of movements at the intersection.

Table 11 Summary of 2038 aggregate intersection delay calculations

Intersection	Peak	Base (vehicle minutes)	Reconfiguration option 1		Reconfiguration option 2	
			Vehicle minutes	Increase from base (%)	Vehicle minutes	Increase from base (%)
A1: Gore Highway / Madelaine Street North	AM	3 min 11s	2 min 42s	-15%	2 min 50s	-11%
	PM	3 min 36s	3 min 2s	-15%	3 min 11s	-11%
A2: Gore Highway / Madelaine Street South	AM	3 min 17s	3 min 2s	-8%	3 min 32s	-8%
	PM	4 min 50s	4 min 26s	-8%	4 min 26s	-8%
B: Gore Highway / Ware Street / Saal Road	AM	6 min 46s	34s	-92%	16s	-96%
	PM	7 min 36s	28s	-94%	16s	-97%
C: Gore Highway / Ware Street	AM	2 min 41s	2 min 40s	-1%	2 min 40s	-1%
	PM	5 min 54s	5 min 55s	0%	5 min 55s	0%
D: Ware Street / Lord Street	AM	4 min 49s	4 min 49s	0%	4 min 52s	1%
	PM	3 min 52s	3 min 52s	0%	3 min 59s	3%
Total		46min 32s	31min 28s	-32%	31min 26s	-32%

Note: Intersection B has decreased delay in the options compared to the base case due to the closure of movements at the intersection.

Table 11 provides a summary of the aggregate intersection delay calculations for the design horizon year (2038), and whether the intersection exceeds 5% of additional delay. There are no increases in delay for pre-existing traffic under reconfiguration option 1 or reconfiguration option 2. The aggregate delay across all intersections is less than 5% therefore no mitigation works are required.

The detailed SIDRA results are included as Appendix E. All intersections assessed are expected to be operating well within acceptable capacity limits at the year of opening and design horizon both without, and with, the additional traffic forecast to be rerouted by the proposed grade separated crossing reconfiguration options. Therefore, no mitigation works are required.

7.2.1 Intersection assessment summary

Therefore, no mitigation works are warranted any of the assessed intersections to support the traffic forecast to be generated by the proposed options.

DRAFT

8 Transport infrastructure assessment

The purpose of this proposed project is to enable Inland Rail to operate, and includes grade separation of the Gore Highway / Railway intersection, where the road will ramp up and over the railway. Therefore, railway crossing safety at this location has not been included in the impact mitigation assessment.

The following section assesses the overhead clearance for the Saal Road underpass within the project area. The impact on any bridges or culverts has not been included within this report as it is expected to be covered within the Environmental Impact Statement (EIS) flooding/hydraulic reporting. Similarly, rail design aspects such as gradients has not been included within this report as it is expected to be covered elsewhere within the EIS.

Note that this is a desktop assessment for an EIS, and as such there is limited civil design within this report. Further design considering provisions such as Wide Centre Line Treatments (WCLT) will be documented within a Technical Advice Note as a part of the Tender Design.

8.1 Overhead clearance for Saal Road and Ware Street

Table 3.5.4.2 of Design Criteria for Bridges and Other Structures (TMR, 2021) (shown in Figure 15 below) states the minimum vertical clearances for bridges over roads. The document states that the minimum clearance between a structure and the surface of the road below it should be 6.5 m.

Because of the high heavy vehicle volumes throughout the Gore Highway traffic flows and the detour arrangements, it is recommended that any underpasses be able to accommodate all heavy vehicles heights. The existing rail vertical clearance is approximately 8m at this particular structure therefore achieving a higher clearance of 6.5m is not an issue for Ware St/ Saal Road.

Table 3.5.4.2 – Minimum vertical clearances for bridges over roads

Description of road beneath bridge	Preferred minimum	Absolute minimum
Very high clearance routes (where no suitable convenient alternative is available)	6.5 m [1], [2]	6.0 m [3]
Highways and motorways	6.0 m [2]	5.5 m [2], [3]
Declared roads	5.5 m [2]	5.5 m [2]
Other arterial and main roads	5.5 m [2]	5.5 m [2]
Other local authority roads	5.3 m [2]	4.8 m [4]

Figure 15 Extract of Table 3.5.4.2 from Design Criteria for Bridges and Other Structures (TMR, 2021)

8.1.1 Overhead clearance assessment summary

A 6.5m clearance between the structure and surface of the road below is recommended when the development progresses to more detailed design.

8.2 Swept paths

This is a desktop assessment and due to the heavy vehicle percentages currently carried through the study area, it is assumed the existing swept paths are sufficient. Further swept path analysis is recommended to be undertaken during detailed design and construction road safety audits.

9 Safety assessment

9.1 Sight distance assessment

The project intersections have been assessed to determine if there were any existing sight distance issues that may worsen with the proposed changes to the traffic movements. The sight distance checks were based on the requirements as stated in *Austroads Guide to Road Design Part 3* and *Part 4A*. The following sight distance checks have been undertaken for the SCR intersections within the study area:

- Stopping Sight Distance (SSD)
- Approach Sight Distance (ASD)
- Safe Intersection Sight Distance (SISD)
- Minimum Gap Sight Distance (MGSD)

The formulas and diagrams for these calculations are shown below in Figure 16.

SSD

$$SSD = \frac{R_T V}{3.6} + \frac{V^2}{254(d + 0.01a)}$$

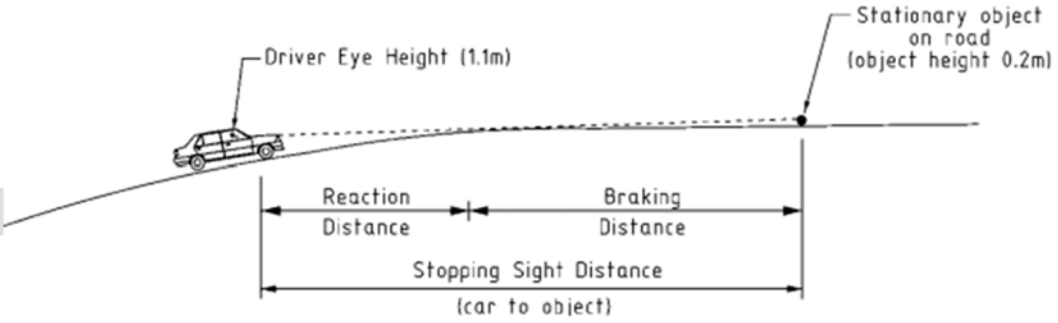
where

R_T = reaction time (sec)

V = operating speed (km/h)

d = coefficient of deceleration (longitudinal friction factor)

a = longitudinal grade (%, + for upgrades and – for downgrades)



DRAFT

ASD

$$ASD = \frac{R_T \times V}{3.6} + \frac{V^2}{254 \times (d + 0.01 \times a)}$$

where

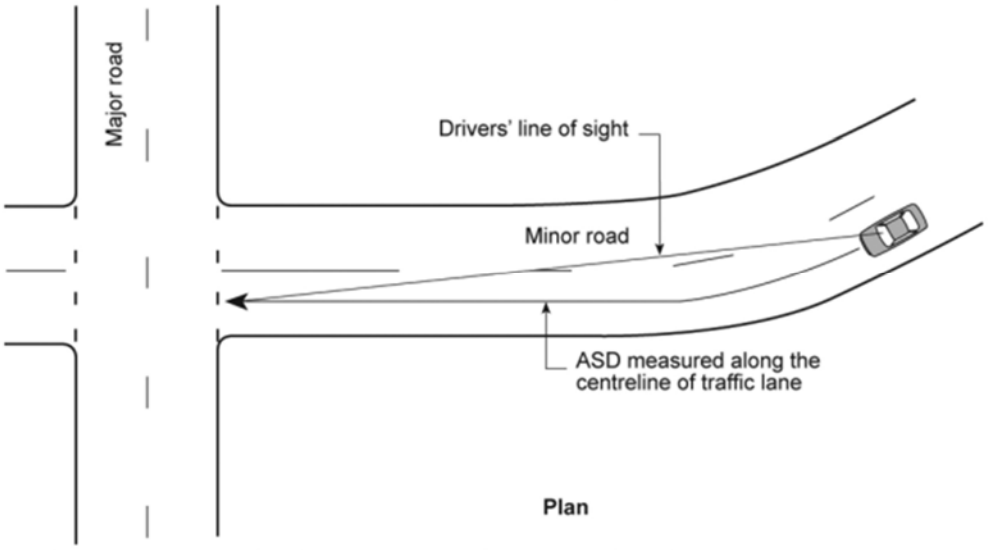
ASD = approach sight distance (m)

R_T = reaction time (sec), refer to *AGRD Part 3* (Austroads 2016b) for guidance on values

V = operating (85th percentile) speed (km/h)

d = coefficient of deceleration, refer to Table 3.3 and *AGRD Part 3* for values

a = a longitudinal grade in % (in direction of travel: positive for uphill grade, negative for downhill grade)



Plan

SISD

$$SISD = \frac{D_T \times V}{3.6} + \frac{V^2}{254 \times (d + 0.01 \times a)}$$

where

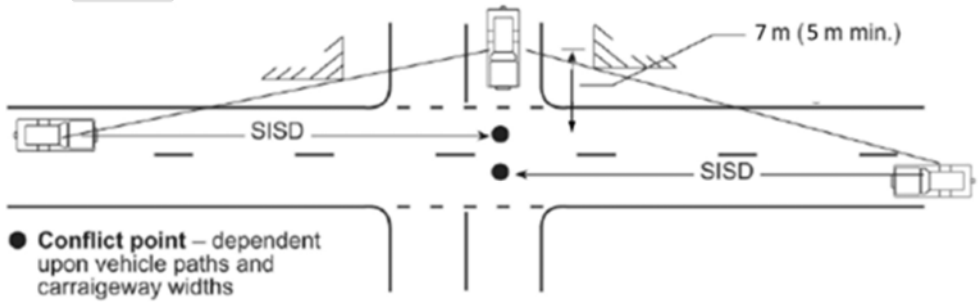
SISD = safe intersection sight distance (m)

D_T = decision time (sec) = observation time (3 sec) + reaction time (sec) – refer to *AGRD Part 3* (Austroads 2016b) for a guide to values

V = operating (85th percentile) speed (km/h)

d = coefficient of deceleration – refer to Table 3.3 and *AGRD Part 3* for a guide to values

a = longitudinal grade in % (in direction of travel: positive for uphill grade, negative for downhill grade)



Plan

MGSD

Table 3.6: Table of minimum gap sight distances ('*D*' metres) for various speeds

Critical gap acceptance time (t_a) (secs)	85th percentile speed of approaching vehicle (km/h)										
	10	20	30	40	50	60	70	80	90	100	110
4	11	22	33	44	55	67	78	89	100	111	122
5	14	28	42	55	69	83	97	111	125	139	153
6	17	33	50	67	83	100	117	133	150	167	183
7	19	39	58	78	97	117	136	155	175	194	214
8	22	44	67	89	111	133	155	178	200	222	244
9	25	50	75	100	125	150	175	200	225	250	275
10	28	56	83	111	139	167	194	222	250	278	305

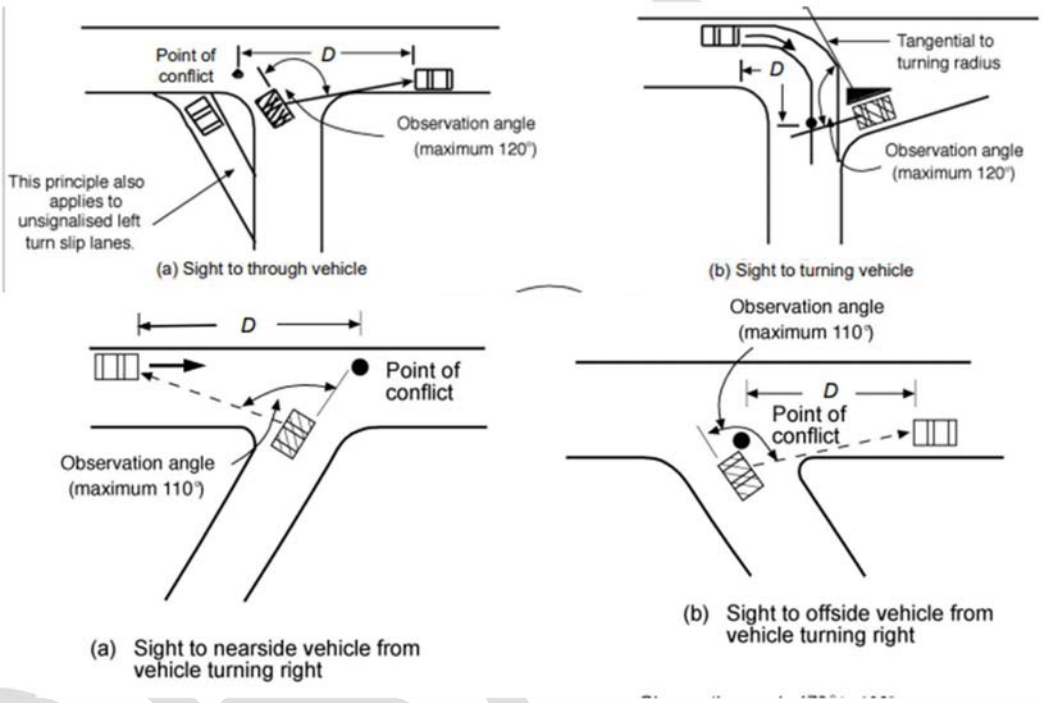


Figure 16 Extract from Austroads Guide to Road Design Part 3 and Part 4A

Note that this is a preliminary assessment undertaken as a desktop assessment only, and once further design is available for the height of the Gore Highway bridge over the Inland Rail line it is recommended that this assessment be revisited to check there are no obstructions to sight distances. This assessment may need to be revisited when further detailed survey is made available.

Neither Option 1 or Option 2 service road require sight distance checks, as Option 1 has an acceleration lane, and Option 2 does not allow vehicles to turn onto the Gore Highway.

9.1.1 Intersection A1 and A2: Gore Highway / Madelaine Street

This assessment is applicable to reconfiguration option 1 and reconfiguration option 2 as the proposed Intersection A1 and A2 layouts are common to both. Figure 17 shows the imagery used for the assessment.

The required SSD for cars and trucks based on a reaction time of 2.5 seconds and a design speed of 110 km/h on the Gore Highway is 209 m and 241 m. The existing situation achieves 300 m.

Madelaine Street west approach has an advisory speed of 40km/h due to the horizontal curve approach to the highway and vehicles will be limiting their speed through this curve. Madelaine Street east approach coming from a residential area hence does not anticipate vehicles to accelerate to 70km/h or higher speeds. Hence it is appropriate to consider a design speed of 70km/h in ASD assessment for Madelaine Street intersections A1 and A2.

The Madelaine Street ASD to the intersections with Gore Highway for a design speed of 70 km/h and reaction time of 2.0 seconds requires 92 m which is achieved in the existing situation.

The required SISD in accordance with AGRD Part 4A Table 3.2 of 151 m for Madelaine Street and 300 m for Gore Highway is achieved.

A MGSD of 378 m is achieved for the right turn movement from Madelaine Street onto the Gore Highway. This equates to a critical gap acceptance of 14 seconds. Neither Option 1 nor 2 adds any traffic movements to the right turn movement, therefore it is not required to be mitigated by IR B2G project, however additional signage could be considered by TMR (i.e., No heavy vehicle turns allowed) if there are concerns around the existing situation of critical gap acceptance. The MGSD for the left turn movement from Madelaine Street onto the Gore Highway of 303 m is achieved, which equates to a critical gap acceptance of 11 seconds.

Figure 17 Gore Highway / Madelaine Street – aerial imagery used for sight distance assessments

9.1.2 Intersection C: Gore Highway / Ware Street

This assessment is applicable to reconfiguration option 1 and reconfiguration option 2 as the proposed Intersection C layout is common to both. Figure 18 provides the imagery used for the assessment.

The required SSD for cars and trucks based on a reaction time of 2.5 seconds and a design speed of 110 km/h on the Gore Highway is 209 m and 241 m. The proposed design achieves 300 m.

The Ware Street ASD to the intersection with Gore Highway for a design speed of 70 km/h and reaction time of 2.0 seconds requires 92 m, which is achieved in the existing situation.

The required SISD in accordance with AGRD Part 4A Table 3.2 of 151 m for Ware Street and 300 m for Gore Highway is achieved.

A MGSD of 405 m is achieved for the right turn movement from Ware Street onto the Gore Highway. This equates to a critical gap acceptance of >14 seconds. The MGSD for the left turn movement from Ware Street onto the Gore Highway of 380 m is achieved, which equates to a critical gap acceptance of 14 seconds.

Figure 18 Gore Highway / Ware Street– aerial imagery used for sight distance assessments

9.1.3 Sight distance assessment summary

This assessment is applicable to reconfiguration option 1 and reconfiguration option 2 as the intersections A1, A2, and C layouts are common to both options. Neither Option 1 or Option 2 service road require sight distance checks, as Option 1 has an acceleration lane, and Option 2 does not allow vehicles to turn onto the Gore Highway.

There are no existing sight distance issues for intersections that are proposed to be used by detoured vehicles. There are no project impacts that require mitigations.

This assessment has limited accuracy due to the desktop nature and these assessments should be revisited when further detailed survey is available in the future.

9.2 Acceleration lanes

This assessment is applicable to reconfiguration option 1 Gore Highway Service Road left-turn onto the Gore Highway only. Reconfiguration option 2 does not include this left-out movement.

In accordance with *Austroads Guide to Traffic Management Part 6 Section 3.3.5*, there are no directly applicable numerical warrants for the provision of acceleration lanes on the Gore Highway segment in question. An auxiliary lane may be added on the departure side of a left turn lane if traffic is unable to join safely with the adjacent through traffic speed. *AGTM Part 6 Section 3.3.5* states:

Acceleration lanes are only provided where:

- Insufficient gaps exist for vehicles to enter a traffic stream
- Turning volumes are high (e.g., 300 to 500 veh/hr)
- The observation angle falls below the requirements of the minimum gap sight distance
- Heavy vehicles pulling into the traffic stream would cause excessive slowing of major road vehicles

The following extracts are from AGRD Part 4A and TMR Route Assessment for minimum acceleration lengths.

DRAFT

Austroads Guide to Road Design Part 4A

Table 5.8 of *AGRD Part 4A* (shown in Figure 19 below) states the required acceleration lanes for a semi-trailer to accelerate from rest. Noting that the dashed lanes indicate that it is not practical to provide sufficient acceleration lane length. The table shows that an uphill grade of 3% would be considered not practical.

Table 5.8: Acceleration lane lengths (m) for semi-trailers to accelerate from rest to a speed on an upgrade

Upgrade (%)	Truck speed (km/h)						
	100	90	80	70	60	50	40
1	–	–	2000	890	480	230	100
2	–	–	–	–	890	320	130

Note: Dashes indicate that it is not practical to provide sufficient acceleration lane length for semi-trailers to reach the speeds indicated.

Figure 19 Extract of Table 5.8 from Austroads Guide to Road Design Part 4A

TMR Route Assessment for Multi-Combination Vehicles and Performance Based Standards vehicles

Table 4.12 of the TMR Route Assessment for Multi-Combination Vehicles (MCV) & Performance Based Standards (PBS) vehicles outlines minimum acceleration lane lengths (shown in Figure 20 below). Similar to AGRD Part 4A, acceleration lanes on grades of 3% are not considered practical.

An acceleration lane would require two eastbound lanes over the full extent of the road bridge (approx. 1,200m).

Table 4.12 – Minimum acceleration lane length (Sources: TMR 2013 and Gough 2019))

Vehicle Classification	Average grade of the acceleration lane (%)					
	Downhill			Level	Uphill	
	-4	-2	-1	0	1	2
Through road speed limit = 80 km/h (heavy vehicle entry speed = 56 km/h)						
B-double, Level 2 PBS vehicle	190	270	350	510	1,090	–
Type 1 road train, Level 3 PBS vehicle	200	280	370	570	1,500	–
Type 2 road train, Level 4 PBS vehicle up to 120 tonnes	220	330	460	790	–	–
Through road speed limit = 110 km/h (heavy vehicle entry speed = 77 km/h)						
B-double, Level 2 PBS vehicle	410	630	910	1,620	–	–
Type 1 road train, Level 3 PBS vehicle	420	670	970	1,870	–	–
Type 2 road train, Level 4 PBS vehicle up to 120 tonnes	470	760	1,180	–	–	–

Figure 20 Extract of Table 4.12 from TMR Route Assessment for MCV and PBS vehicles

9.2.1 Reconfiguration option 1: Service Road left-turn onto Gore Highway

For further details around the proposed design of the Gore Highway Service Road arrangement refer to within a Technical Advice Note as a part of the Tender Design.

For reconfiguration option 1 Gore Highway Service Road left-turn onto the Gore Highway only the following design observations are made:

- Sufficient Safe Intersection Sight distance (SISD) and Minimum Gap Sight Distance (MGSD) are achieved in accordance with AGRD Part 4A.
- 2028 daily left-out turn movements are forecast to be 152 vehicles/day (117 light vehicles, 15 heavy vehicles, and 20 extra heavy vehicles).
- 2028 AM peak of 16 vehicles/hour (12 light vehicles, 2 heavy vehicles and 2 extra heavy vehicles).
- The gradient is proposed to be 3% uphill grade on approach to the rail overpass.
- Posted speed of 100km/h on the Gore Highway.
- If there is no acceleration lane,
  - turning vehicles would have a stop sign, and therefore be starting from 0km/hour.
  - The Gore Highway has a single lane carriageway in both directions.
  - Vehicles turning left onto the Gore Highway may cause excessive slowing of the major road vehicles while they accelerate.
  - There is a large speed differential between turning (starting from 0km/h) and through traffic (100km/h) in the same lane.
  - Due to the Gore Highway high heavy vehicle proportion, there is a greater risk of a serious impact if a crash occurred for vehicles turning onto the Gore Highway.
- If there was an acceleration lane,
  - turning vehicles would turn into a continuous lane, allowing them to undertake the turn at a speed of up to 30km/hour.
  - The acceleration lane would need to be very long to allow for the 3% uphill gradient on approach to the rail overpass.
  - Vehicles turning left onto the Gore Highway would not impact on the speed of the major road vehicles while they accelerate.

Therefore, the assessment indicates that if a Service Road left-turn onto Gore Highway is allowed, an acceleration lane is required to provide a safe environment for all vehicles. Allowing the Service Road left-turn onto the Gore Highway without an acceleration lane is not recommended due to the high safety risks discussed.

It is recommended that the design of the acceleration lane and this assessment be revisited when detailed survey information is available at a later date.

9.3 Turn warrants assessment

A turn warrants assessment was undertaken for the upgrade design to determine the requirements for turn provisions at the affected intersections.

This turn warrants assessment determines the required provisions for turning movements to provide safety through avoidance of rear-end crashes.

The scenarios assessed were:

- existing conditions
- reconfiguration option 1
- reconfiguration option 2

This assessment will confirm if the construction of the grade-separation worsens the intersection to a point where an upgrade must be provided. Table 12 shows the turn treatment options.

DRAFT

Table 12 Turn treatment examples

Turn Treatment	Diagram
Basic Right Turn (BAR) on the Major Road	Basic Left Turn (BAL) on the Major Road	Auxiliary Right Turn (AUR) on the Major Road	Auxiliary Left Turn (AUL) on the Major Road	Channelised Right Turn (CHR) on the Major Road Note: CHR(s) indicates a short Channelised Right Turn	Channelised Left Turn (CHL) on the Major Road	
Intersection A2 (Gore Highway / Madelaine Street South) currently has BAL and CHR(s) treatments. Intersection A1 (Gore Highway / Madelaine Street North) contains AUL(s) and CHR(s) treatments, whereas intersection C (Gore Highway / Ware Street) is currently designed with BAL and AUR treatments. Intersection D (Ware Street / Lord Street / Brookstead Scrubby Road) is not designed with any left or right turn treatments leading into either Lord Street or Brookstead Scrubby Road.

Toowoomba Regional Council has noted the following intersections as having existing non-compliant turn treatments in accordance with the Austroads Guide to Traffic Management Part 6.

- A1 CHR(s) ~93m lane length shorter than recommended 185m length to account for safe decoration speed from 110km/h to stop.
- A1 AUL(s) ~130m lane length is sufficient for deceleration speeds from design speed 110km/h to 60km/h. 180m AUL(s) length preferable for decelerating from 110km/h to 20km/h
- A2 insufficient BAL shoulder width
- A2 CHR(s) ~92m lane length shorter than recommended 185m length to account for safe decoration speed from 110km/h to stop.
- C insufficient BAL shoulder length
- C insufficient AUR auxiliary lane length

The scope of this turn warrant assessment focuses on the impact of the B2G project and does not include existing issues. Further turn warrant analysis is recommended to be undertaken during detailed design and construction road safety audits.

A turn warrant assessment was conducted for intersections A1, A2, C and D using the peak hour turn volumes for the base year 2021, opening year 2028 and design horizon year 2038 to determine the appropriate turn layout arrangement suitable for each of the reconfiguration design options using the assessment criteria set out in table 3.25 of the Austroads Guide to Traffic Management Part 6. An extract of this table has been provided in Figure 21 for reference.

Figure 3.25: Warrants for turn treatments on major roads at unsignalised intersections

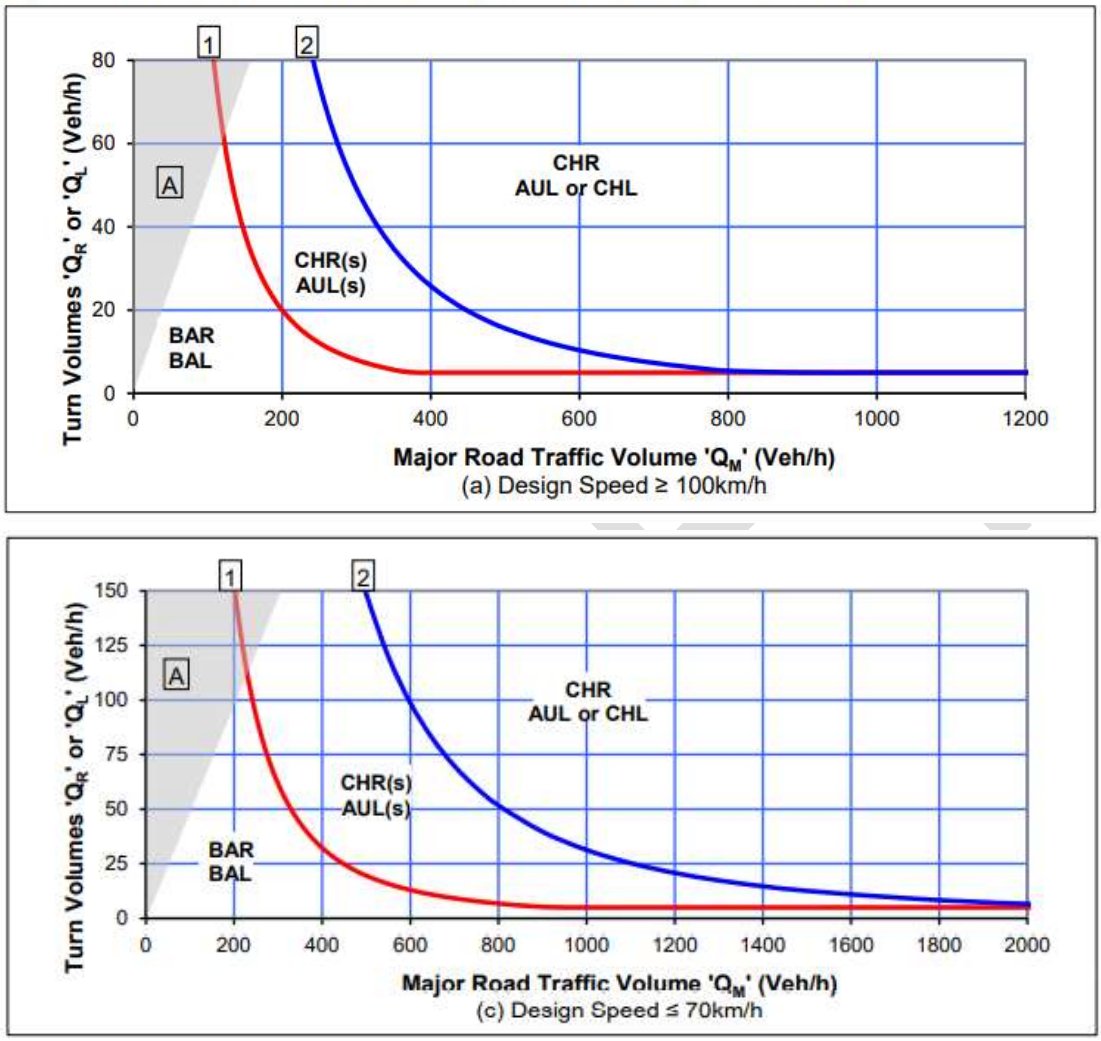

Figure 21 Austroads Guide to Traffic Management Part 6 turn warrant criteria

Table 13 summarises the turn treatments required for each year, movement, and scenario at the Gore Highway intersections A1, A2, C and D. It details the required turn treatment for the left and right turns out of the Gore Highway onto the connecting roads. If a turn is assessed to require a turn treatment that is of lower order than the existing layout, the existing treatment will be maintained.

The results show that the existing turn treatments in place at intersections A1, A2, C and D are suitable given the peak hour traffic conditions for 2021 and 2028 according to the AGTM Part 6 criteria. However, the traffic movements predicted by the design horizon year 2038 have triggered the threshold for the following turn treatment upgrade:

- CHR treatment required for intersection A2: Gore Highway / Madelaine Street in existing conditions and both reconfiguration options scenarios

Note this treatment is required by 2038 due to the existing traffic volumes. The turn treatment is not required as a mitigation measure by the development to address turn warrant criteria.

For reference, the Gore Highway / Madelaine Street staggered intersection has been split into 2 separate turn warrant assessments for the northern intersection (A1) and southern intersection (A2) as depicted in Figure 22.

Figure 22 Gore Highway / Madelaine Street Turn Warrant Movement Locations (QLD Globe, 2020)

Full turn warrant assessment results are detailed in Appendix F.

9.3.1 Turn warrants assessment summary

This section of the report completes a turn warrant assessment only, and it is then overlayed with safety assessment (including TMR Road Safety Policy within the risk assessment (Section 9.5).

The results show that the existing turn treatments in place at intersections A1, A2, C and D are suitable given the peak hour traffic conditions for 2021 and 2028 according to the AGTM Part 6 criteria. However, the traffic movements predicted by the design horizon year 2038 have triggered the threshold for the following turn treatment upgrade:

- CHR treatment required for intersection A2: Gore Highway / Madelaine Street in existing conditions and both reconfiguration options scenarios. Note this treatment is required by 2038 due to the existing traffic volumes. The turn treatment is not required as a mitigation measure by the development to address turn warrant criteria.

The turn warrants assessment concludes that there are no impacts caused by the project that require mitigation. Further assessment during detailed design and construction phase road safety audits is recommended as this is a limited desktop assessment.

9.4 Movement volumes

Individual movement 24-hour volumes compared between the reconfiguration options and base are highlighted in Appendix C.

According to TMR GTIA guidelines, any movement volume that increases more than 5% from the base case volume requires a risk assessment to determine whether risk has increased to the next level as a result of the proposed development.

Table 14 Movement volumes exceeding 5% of base case volumes

Intersection	Movement	Reconfiguration option 1	Reconfiguration option 2
Intersection A1: Gore Highway / Madelaine Street North	None	No	No
Intersection A2: Gore Highway / Madelaine Street South	Gore Highway southbound left turn onto Madelaine Street west	Requires risk assessment	Requires risk assessment
Intersection B: Gore Highway / Ware Street / Saal Road	Saal Road southbound through movement	Requires risk assessment	Requires risk assessment
	Gore Highway westbound through movement	Requires risk assessment	Requires risk assessment
	Gore Highway eastbound left turn into Service Road	Requires risk assessment	Requires risk assessment
Intersection C: Gore Highway / Ware Street	Ware Street left turn onto Gore Highway southbound	Requires risk assessment	Requires risk assessment
Intersection D: Ware Street / Lord Street	Lord Street southbound left turn into Ware Street	Requires risk assessment	Requires risk assessment
	Ware Street westbound through movement	No	Requires risk assessment

The subsequent sections of this report provide the risk assessments for the identified movements.

9.5 Risk assessment

A risk assessment has been undertaken to identify and assess existing safety risks, assess impacts of the proposed reconfiguration to understand if there is an increase in road safety risk or if any existing risk is unacceptable.

Table 15 documents the discussion of individual movement risks, as identified within the movement volume assessment in the previous section.

Due to the low traffic volumes, the normal GTIA risk assessment categories of 'decreases in intersection performance due to increased delays and queues' and 'turn pocket queues spilling into other lanes' have not been assessed in the risk table, as a Low level of safety risk has been calculated.

Table 15 Discussion of individual movement risks

Intersection	Movement	Reconfiguration option 1	Reconfiguration option 2
Intersection A2: Gore Highway / Madelaine Street South	Gore Highway southbound left turn onto Madelaine Street west	There is an increase in volume of traffic completing this movement due to detouring. However due to the very low volumes, the capacity and delay assessments identifies that the volumes can be catered for within the current intersection form safely. The sight distance assessment identifies that sufficient sight distance is available, and turn warrants assessment indicates that the available storage provides sufficient acceleration and deceleration distance. The crash assessment did not identify any trends at this location.	The risk assessment for reconfiguration option 2 is the same as reconfiguration option 1.
Intersection B: Gore Highway /	Saal Road southbound	There is an increase in volume of traffic completing this movement due to detouring. However due to the very low	The risk assessment for reconfiguration option 2 is the same as reconfiguration option 1.

Ware Street / Saal Road	through movement	volumes, the capacity and delay assessments identifies that the volumes can be catered for within the proposed intersection layout. This intersection will have reduced risk as there is grade separation of the Gore Highway and Saal Road, reducing the risk of conflicts.	
	Gore Highway westbound through movement	This movement has triggered a risk assessment due to detouring, where 5% of the traffic is relocated to the proposed service Road intersection, and be detoured through the local network rather than travelling through this intersection. This intersection will have reduced risk as there is grade separation of the Gore Highway and Saal Road, reducing the risk of conflicts. There will be zero conflicting turning movements with the proposed intersection layout.	This movement has triggered a risk assessment due to detouring, where 5% of the traffic is relocated to the proposed service Road intersection, and be detoured through the local network rather than travelling through this intersection. This intersection will have reduced risk as there is grade separation of the Gore Highway and Saal Road, reducing the risk of conflicts. There will be zero conflicting turning movements with the proposed intersection layout. The Service Road will have reduced risk compared to reconfiguration option 1, as the Service Road will be one-way only, and there will be no turning movements turning into the Service Road from Saal Road. There is an additional safety concern with compliance of road users of the one-way service road arrangement in the rural context.
	Gore Highway eastbound left turn into Service Road	This is a proposed intersection, and the volume has been compared to the previous Gore Highway to Saal Road left turn. There is an increase in volume of traffic completing this movement due to detouring. The capacity and delay assessments identifies that the volumes can be catered for within the proposed intersection form safely. The sight distance assessment identifies that sufficient sight distance is available, and turn warrants assessment indicates that the proposed storage provides sufficient acceleration and deceleration distance.	The risk assessment for reconfiguration option 2 is the same as reconfiguration option 1.
Intersection C: Gore Highway / Ware Street	Ware Street left turn onto Gore Highway southbound	There is an increase in volume of traffic completing this movement due to detouring. However due to the very low volumes, the capacity and delay assessments identifies that the volumes can be catered for within the current intersection form safely.	The risk assessment for reconfiguration option 2 is the same as reconfiguration option 1.

		The sight distance assessment identifies that sufficient sight distance is available. The turn warrant assessment indicates that in 2038, further CHR treatment is required for this movement, in both the existing base case and for the reconfiguration option. The crash assessment did not identify any trends at this location.	
Intersection D: Ware Street / Lord Street	Lord Street southbound left turn into Ware Street	There is an increase in volume of traffic completing this movement due to detouring. However due to the low volumes, the capacity and delay assessments identifies that the volumes can be catered for within the current intersection form safely. No crash data was available for this intersection.	The risk assessment for reconfiguration option 2 is the same as reconfiguration option 1
	Ware Street westbound through movement	No risk assessment required for reconfiguration option 1.	There is an increase in volume of traffic completing this movement due to detouring. However due to the low volumes, the capacity and delay assessments identifies that the volumes can be catered for within the current intersection form safely. No crash data was available for this intersection.

Risk scores have been determined in accordance with the GTIA Safety risk score matrix shown in Figure 23.

Figure 9.3.2(a) – Safety risk score matrix

		Potential consequence				
		Property only (1)	Minor injury (2)	Medical treatment (3)	Hospitalisation (4)	Fatality (5)
Potential likelihood	Almost certain (5)	M	M	H	H	H
	Likely (4)	M	M	M	H	H
	Moderate (3)	L	M	M	M	H
	Unlikely (2)	L	L	M	M	M
	Rare (1)	L	L	L	M	M

L: Low risk
M: Medium risk
H: High risk

Figure 23 GTIA Safety Risk Score Matrix

The cluster of crashes identified previously are located very close to the proposed Gore Highway / Service Road intersection. As one crash resulted in a fatality, the potential consequence for the existing intersection

has been scored as Fatality (5), providing a safety risk score matrix result of High. Reconfiguration option 1 and reconfiguration option 2 will align the private access to the service road and therefore will not have a worsening effect on the safety issues of this location.

The risk assessment process is documented in Table 16. The results indicate that while there are some changes in Likelihood scores, there is no increase in road safety risk categories for any intersections for reconfiguration option 2. There are no additional mitigation measures that are required for reconfiguration option 2.

The acceleration lane assessment indicates that if a Service Road left-turn onto Gore Highway is allowed, an acceleration lane is required to provide a safe environment for all vehicles. Allowing the Service Road left-turn onto the Gore Highway without an acceleration lane is not recommended due to the high safety risks discussed. Therefore, the mitigation measure required is to provide an acceleration lane.

TMR's Road Safety Policy Fact Sheet 06 recommends replacing AUR treatments with CHR(s). The Road Safety Policy will be considered in detail through the next stages of the project, where road safety audits and traffic management plans are completed.

The grade separated crossing project is not designated as either a Major Development or Planning Act Development as per table 9.3.3(b) of the GTIA guidelines. It is recommended that a road safety assessment be undertaken during the feasibility stage of this project and a road safety audit be conducted as it progresses to detailed design.

DRAFT

Table 16 Risk assessment summary

Risk Item		Existing			With reconfiguration option 1			With reconfiguration option 2		
		Likelihood	Consequence	Result	Likelihood	Consequence	Result	Likelihood	Consequence	Result
Changes in infrastructure network (physical changes, and visibility)	**A1 and A2:** Gore Hwy / Madelaine St	3	4	M	3	4	M	3	4	M
	B: Gore Hwy / Ware St / Saal Rd	4	5	H	4	4	H	2	4	M
	C: Gore Hwy / Ware St	2	4	M	2	4	M	2	4	M
	D: Ware St / Lord St	2	3	M	2	3	M	2	3	M
Increase in traffic volume, including more traffic introduced on narrow rural roads.	**A1 and A2:** Gore Hwy / Madelaine St	3	4	M	3	4	M	3	4	M
	B: Gore Hwy / Ware St / Saal Rd	4	4	H	3	4	M	2	4	M
	C: Gore Hwy / Ware St	3	4	M	3	4	M	3	4	M
	D: Ware St / Lord St	2	3	M	3	4	M	3	4	M
Introduction or increases in over-dimension or heavy vehicles	**A1 and A2:** Gore Hwy / Madelaine St	3	4	M	3	4	M	3	4	M
	B: Gore Hwy / Ware St / Saal Rd	4	4	H	3	4	M	2	4	M
	C: Gore Hwy / Ware St	3	4	M	3	4	M	3	4	M
	D: Ware St / Lord St	2	4	M	3	4	M	3	4	M

DRAFT

10 Recommendations

Note, as this report forms part of the EIS stage of the project, this report is a desktop assessment and does not assess the GTIA impact categories of construction traffic or pavement impacts as there is not sufficient detail to undertake this assessment at this stage. This will enable further work to be undertaken to address comments from TMR about pavement maintenance requirements (noting that roads are generally sealed through Brookstead), and signage updates. This work has started and is in the process of being documented within a Technical Advice Note as a part of the Tender with tasks such as site visits, road safety audits, and detailed design.

This assessment includes:

- **Reconfiguration option 1**: The service road will provide left-in left-out (LILO) access at the Gore Highway and all movements at the Saal Road / Ware Street / service road intersection.
- **Reconfiguration option 2**: The service road will provide left-in (LI) access at the Gore Highway and through movements at the Saal Road / Ware Street/ service road intersection.

The assessment concludes:

Table 17 Impact assessment and mitigation measures summary

Impact Assessment	Reconfiguration option 1	Reconfiguration option 2
Access and frontage	Close the Gore Highway access to 34 Lord Street, and work with the property owner of 5608 Gore Highway to integrate a driveway access into the proposed reconfiguration arrangement, either from the service road, or from Saal Road.	
Road link capacity	No changes to LOS are experienced on any segment of the state controlled or council networks. Therefore, no further mitigation measures are required for any road segment.	
Intersections	**Intersection delay** There are no increases in delay for pre-existing traffic under reconfiguration option 1 or reconfiguration option 2. Therefore, there are no mitigation measures required.	
	Intersection capacity All intersections assessed are expected to be operating within acceptable capacity limits at the year of opening both without, and with, the additional traffic due to reconfiguration option 1 and reconfiguration option 2. No mitigation works are warranted from a capacity perspective at any of the assessed intersections to support the traffic forecast to be generated by the proposed options.	
Transport infrastructure	**Overhead clearance** The same mitigation requirements apply to both reconfiguration options. Because of the high heavy vehicle volumes throughout the Gore Highway traffic flows and the detour arrangements, it is recommended that any underpasses be able to accommodate all heavy vehicles heights. Therefore, a 6.5m clearance between the structure and surface of the road below is recommended.	
Safety	**Sight distance** Sight distance checks result in acceptable outcomes and no mitigation measures are required in addition to the proposed design of either reconfiguration option 1 or reconfiguration option 2.	
	Acceleration lane The assessment indicates that if a Service Road left-turn onto Gore Highway is allowed, an acceleration lane is required to provide a safe environment for all vehicles. Allowing the Service Road left-turn onto the Gore Highway without an acceleration lane is not recommended due to the high safety risks discussed.	No acceleration lanes are a part of the proposed reconfiguration option 2 layout. No mitigation measures are required for reconfiguration option 2. There is an additional safety concern with compliance of road users of the one-way service road arrangement in the rural context.

	It is recommended that the design of the acceleration lane and this assessment be revisited when detailed survey information is available at a later date. Therefore, the mitigation measure required is to provide an acceleration lane.	
	Turn warrant assessment The following turn treatments are recommended for the existing base volume by 2038: ▪ CHR treatment requirement for Intersection C: Gore Highway / Ware Street in existing conditions and both reconfiguration options scenarios No mitigations are required by the development to address turn warrant criteria. The IR B2G project does not require any mitigation measures at the Gore Highway / Madelaine Street (north & south) staged T-intersection, as the project does not trigger an upgrade in the turn treatments.	
	Risk assessment Due to the safety limitations of the Gore Highway / Service Road left-out in reconfiguration option 1, it is recommended that this option not progress, as the left-out movement introduces a risk and maintains an unacceptable risk level for the intersection.	**Risk assessment** The results indicate that while there are some changes in Likelihood scores, there is no increase in road safety risk categories for any intersections for reconfiguration option 2. There are no remaining High risk locations for detour routes. There are no additional mitigation measures that are required for reconfiguration option 2.
Construction traffic	Construction traffic impacts are recommended to be assessed at a later stage when there is more certainty around staging and timeframes. No mitigation measures required at this time.	
Pavement	Pavement impacts are recommended to be assessed at a later stage. No mitigation measures required at this time.	

Either option can proceed from a traffic engineering perspective as the proposal is anticipated to meet the criteria under the TMR Guideline to Traffic Impact Assessment (GTIA). Based on the assessments carried out for the above categories, no mitigations have been identified as required for the opening year (2028), or the design horizon (2038) as a result of the proposed development. From a design perspective, both options require further detailed design assessment in the next stage:

- Reconfiguration option 1 requires further assessment to understand the impacts of the overpass gradient on the Gore Highway through traffic and the acceleration lane length.

Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Queue Model: SIDRA Standard.
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay (SIDRA). Site LOS Method is specified in the Network Data dialog (Network tab).
Vehicle movement LOS values are based on average delay per movement.
Minor Road Approach LOS values are based on average delay for all vehicle movements.
NA: Intersection LOS and Major Road Approach LOS values are Not Applicable for two-way sign control since the average delay is not a good LOS measure due to zero delays associated with major road movements.
Delay Model: SIDRA Standard (Geometric Delay is included).
Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Turn Warrant Assessment Results

DRAFT

Intersection:	**A1 Gore Hwy / Madelaine St**
Year / Peak:	**Existing AM/PM Peak** Scenarios: **2021**

Assessment based on TMR Supplement, Traffic and Road Use Management, Volume 1 - Guide to Traffic Management, Part 6: Intersections, Interchanges and Crossings (2020). This warrant assessment applies only to turning movements from the major road only.

	AM Peak	PM Peak
Q_{T1} =	136	171
Q_R =	2	2

Splitter Island? No

Design speed (km/h) 100

	AM Peak	PM Peak
Q_{T2} =	121	120

Memo

To	Ross Cunneen
From	Jason Richard
Date	20 May 2022
Subject	**B2G EIS TIA – Base Traffic Data and Assessment Methodology**

1 Purpose

ARTC submitted a technical memo on their revised approach to the EIS TIA on 6 May 2022. A meeting was held with the OCG and Queensland Department of Transport and Main Roads (TMR) on 13 May 2022 to discuss this technical memo. As an action from this meeting, ARTC issues this update of the previous technical memo, providing further detail on the below items:

- Base traffic data collection
- Intersection delay assessment methodology
- Road link capacity methodology.

It should be noted that some of the methodology provided towards base traffic data has been refined since the previous technical memo, based on feedback during the OCG and TMR meeting.

2 Base Traffic Data Collection

As part of the traffic data collection task, traffic volumes have been collected along the Project construction routes over the recent years including:

- State Controlled Road (SCR) census-based traffic volumes
- Local Government databases
- Link-based traffic volumes tube counts conducted in
  - September 2019,
  - September/October 2020,
  - March 2021 and
  - March 2022.
- Intersection turning counts conducted in
  - March 2021, around Brookstead
  - March 2022, for the wider network

Where no traffic count data was available or collected for the project, base traffic turning volumes were assumed based on road link volumes. This methodology was undertaken given that:

- Estimated construction vehicle movements through these intersections is very low (further details in Section 3, below) and it is therefore expected that delay impacts for these intersections will not contribute towards the aggregate delay total.

- Estimated survey timeframes are approximately 2-3 months, and is subject to availability of contractors, weather, and suitable non-holiday periods.
- Estimated costs for these additional traffic surveys is approximately $5,000 per site in remote locations. Which, for up to 80 locations is circa $400,000.
- Construction routes are still to be confirmed with the appointed contractor, so until such time the actual intersections requiring traffic survey is also yet to be confirmed. ARTC can commit to undertaking any additional traffic surveys as required within the Impact Assessment Area in the next phase.

A methodology has been developed to provide a conservative analysis that ARTC believes addresses all sections/requirements of the GTIA (2018) to the extent practicable based on available information. It is also noted that traffic surveys for intersection analysis although 'preferred by TMR' are not considered to be mandatory under the GTIA.

This approach is also consistent with TMR's comments on the Basis of Assessment (BoA) for the TIA to present a 'worst case' scenario that conservatively accounts for unknown variables. It should also be acknowledged that an RPEQ will sign off on the methodology for the TIA as required under the GTIA.

ARTC considers the various traffic data collected over the years form a robust basis of traffic data for the EIS TIA assessments in working towards an overall conservative traffic assessment outcome.

3 Proposed Assessment Methodology

3.1 Intersection Delay Assessment

The FFJV constructability assessment nominated 111 intersections to be used by B2G construction traffic. Of these, 75 are TMR intersections. The movement of construction vehicles ranges from 1 vehicle per hour through to 118 vehicles per hour through these intersections, demonstrating the varying degree of transport task along the construction routes. The intersections, and their proposed daily and peak turning movement volumes are provided in Attachment A. Regardless of the number of vehicle movements, each of these intersections listed in Attachment A will be assessed (using SIDRA) as a part of the B2G Traffic Impact Assessment.

Attachment A also highlights the source of base traffic data proposed to be used for the intersection analysis. For intersections with **less than 10 vehicle turning movements per hour** (where base traffic turning volume data is generally not available) a methodology has been proposed which utilises link volume data (rather than specific intersection turning count data) to measure intersection delay. This method is proposed to be applied to 34 TMR intersections. Although the GTIA requires Intersection Delay Analysis to be undertaken at intersections where development traffic exceeds 5% of the base traffic (see Figure 1), our conservative approach to account for all potential impacts will assess intersection delay at all 111 intersections, regardless of whether the 5% threshold has been exceeded.

Intersection delay	All intersections where the development traffic exceeds 5% of the base traffic for any movement in the design peak periods[3] in the year of opening of each stage

Figure 1: GTIA (2018) Intersection Delay Requirements

For the intersections highlighted in Attachment A where base traffic turning volumes were not available, conservative turning volume assumptions will be adopted using the available road link volumes. This will be made to ensure a 'worst case' scenario is considered for delay impacts. This will be undertaken using two "Base Traffic Scenarios".

- Base Traffic Scenario 1 assumes that:
  - 100% of vehicle flow into the minor leg is from the left turn on the major road; and
  - 100% of vehicle flow out of the minor leg turns right from the minor road.

This scenario is expected to test a potential 'worst case' impact scenario for increased delays to:

- right turning movements seeking gaps in the opposing traffic.
- traffic queued behind the right turning vehicles on the major road
- traffic queued behind the right turning vehicles on the minor road.

The above scenario applies to 3-way and 4-way intersections, as outlined in Figure 2 and Figure 3 below.

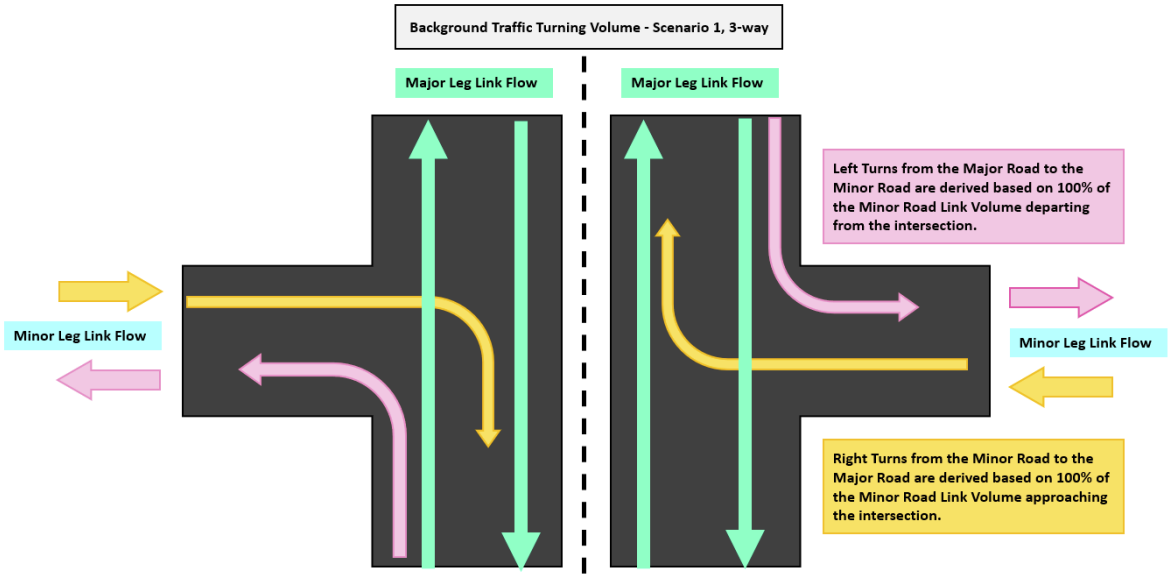

Figure 2: Base Traffic Scenario 1 - 3-way intersection

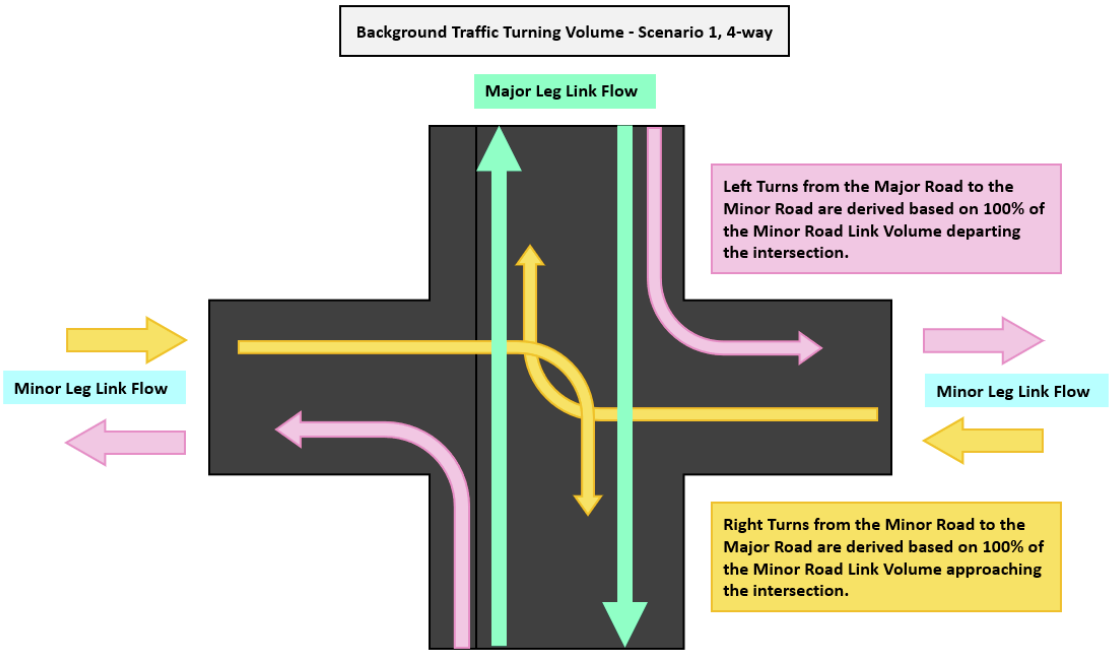

Figure 3: Background Traffic Scenario 1 - 4-way intersection

- Base Traffic Scenario 2 assumes that:
  - 100% of vehicle flow into the minor leg is from the right turn on the major road; and
  - 100% of vehicle flow out of the minor leg turns left from the minor road.

  This scenario is expected to test a potential 'worst case' impact scenario for increased delays to:
  - right turning movements seeking gaps in the opposing traffic.
  - traffic queued behind the right turning vehicles on the major road
  - traffic queued behind the right turning vehicles on the minor road.

  The above scenario applies to 3-way and 4-way intersections, as outlined in Figure 4 and Figure 5 below.

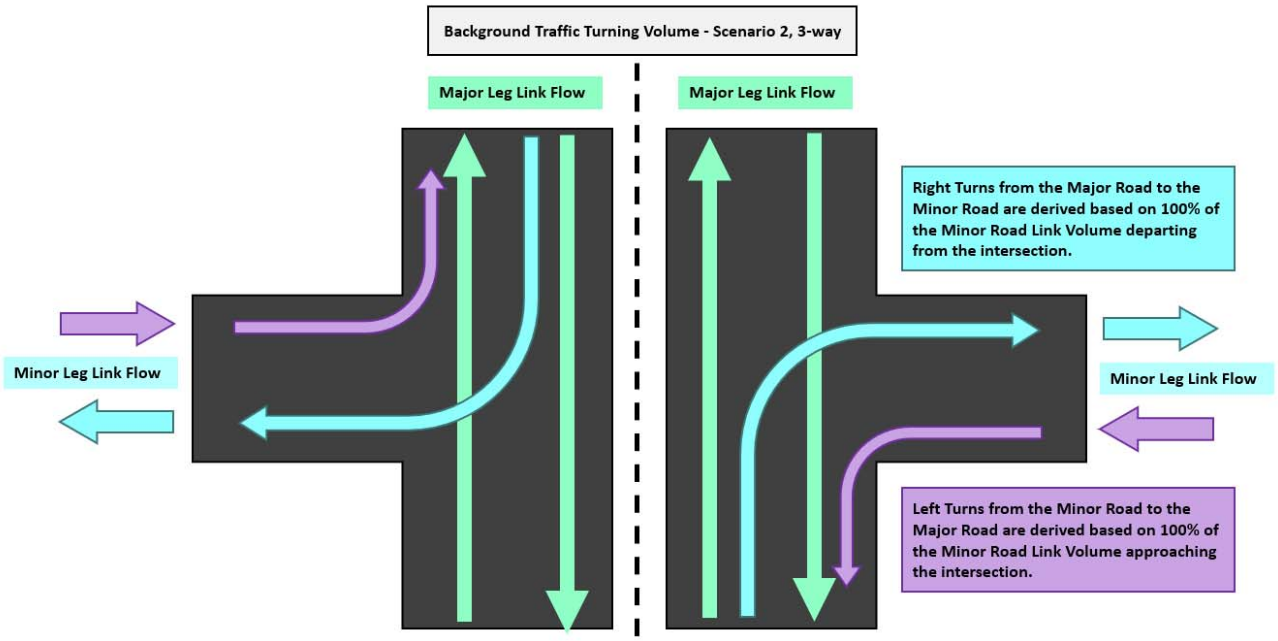

Figure 4: Background Traffic Scenario 2 - 3-way intersection

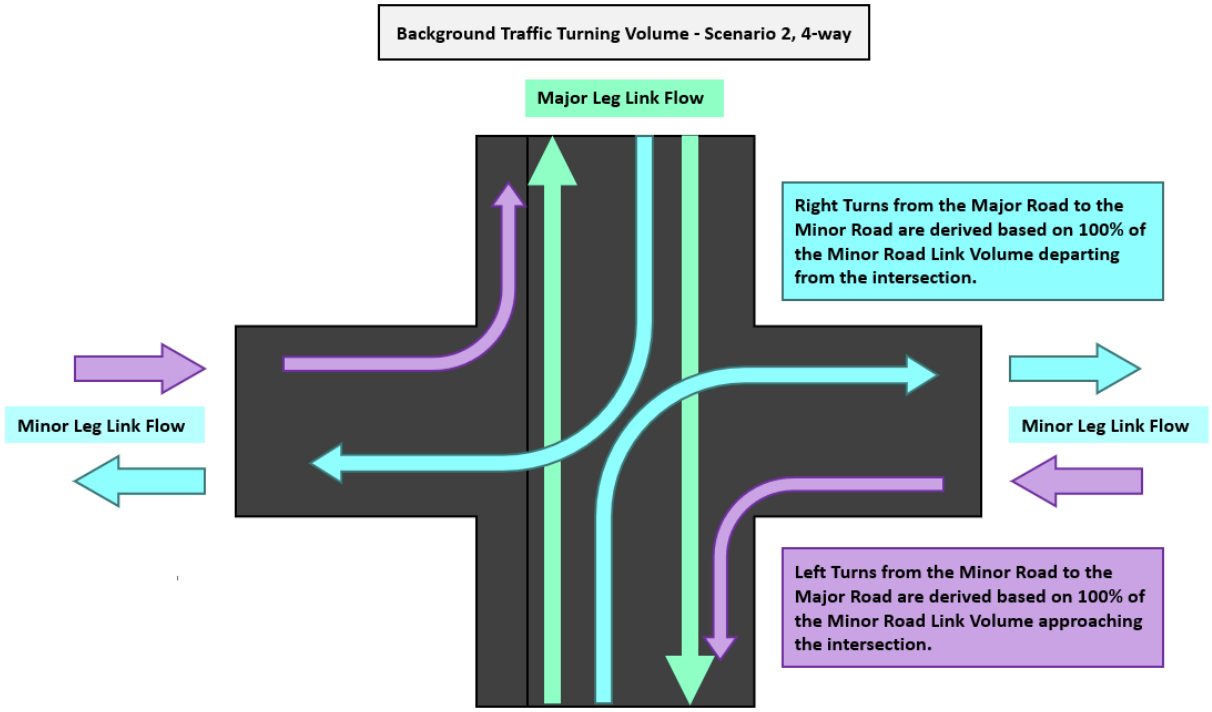

Figure 5: Background Traffic Scenario 2 - 4-way intersection

In general, the construction traffic includes return trips; from the origin, to the site, and back to the origin; with the same construction routes being used in both directions. Therefore, where construction vehicles make a left turn to access the “construction site” (or site access road on the minor leg), the return trip (back to origin) would make a right turn from the minor leg of the intersection. Consistent with this, a left-in / right out OR right-in / left-out movement pair has been assumed for the construction vehicles at intersections along the construction routes.

The construction traffic movements will be assessed against both Base Traffic Scenarios to provide a conservative/’worst case’ scenario in terms of intersection delay. The scenario with the highest delays will be used towards the total "aggregate" delay.

It is noted that there might be some exceptions (i.e. median divided roads with left-in/left out arrangement) which will be assessed on a case by case basis, again using a worst case base turning volume scenario. However, the majority of intersections along the construction routes, where construction traffic would turn from the major leg to the minor leg, would fall under one of the two identified scenarios.

In reality, intersections with ≤10 construction vehicles turning during the peak hour will have an average construction vehicle arrival rate of approximately one vehicle every six minutes. These additional volumes are very unlikely to have any material impact to the operation of any intersection.

3.2 Road Link Capacity Assessment

It is proposed to undertake road link analysis consistent with the GTIA requirements, as shown in Figure 6.

Road link capacity	All road links where the development traffic exceeds 5% of the base traffic in either direction on the link’s annual average daily traffic (AADT) in the year of opening of each stage

Figure 6: GTIA (2018) Intersection Delay Requirements

Base traffic data is available for all road links carrying construction traffic. This data will be used to undertake a link-based assessment to determine whether the construction volumes exceed the base data by the 5% threshold.

For construction road links ≥5% of base traffic, road link assessment will be carried out based on the incremental worsening of level of service (LoS) by using the HCS software and in accordance with Austroads Guidelines and Highway Capacity Manual (7th Edition 2022), as outlined in ARTC's previous technical memo.

4 Recommendations

It is requested that the above methodologies are reviewed by TMR and endorsement/feedback provided by 27 May 2022. It is reiterated that the general approach of the TIA is to follow the procedures as set out in the GTIA (2018), with this memo provided as a supplement to those procedures.

ARTC believes the proposed methodology provides conservative analyses that addresses all sections/requirements of the GTIA to the extent practicable based on available information. This approach is also consistent with TMR's comments on the BoA for the TIA to present a 'worst case' scenario that conservatively accounts for unknown variables.

Attachment A – List of Intersections

Traffic Impact Assessment

Appendix BQ Technical memorandums for TIA methodology to DTMR—cumulative impact assessment

BORDER TO GOWRIE REVISED DRAFT ENVIRONMENTAL IMPACT STATEMENT

Inland Rail is a subsidiary of
Australian Rail Track Corporation

INLAND RAIL

Memo

To	Ross Cunneen
From	Jason Richard
Date	19 July 2022
Subject	**B2G EIS TIA – Cumulative Impacts Assessment Methodology**

1 Purpose

ARTC submitted a technical memo on their revised approach to the EIS TIA on 6 May 2022. A meeting was held with the Office of Coordinator General (OCG) and Queensland Department of Transport and Main Roads (TMR) on 13 May 2022 to discuss this technical memo. As an action from this meeting, ARTC issues this update of the previous technical memo, providing further detail on the Cumulative Impacts Assessment process.

Part of the clarification requested by TMR (via e-mail from OCG on 9 June 2022) on cumulative impacts included the below action:

> *6. ARTC to provide OCG/DTMR clarification of methodology for assessing the cumulative impacts of all Inland Rail sections for all aspects requiring consideration in the Traffic Impact Assessment, not only impacts related to peak volumes. For example, clarify how cumulative impacts on safety and pavement will be taken into account*.

2 Cumulative Impacts

As requested by TMR, the following section provides the methodology to be adopted for assessing the cumulative impacts of Inland Rail sections (NS2B to K2ARB) including the available timing and traffic volumes for the construction activities.

2.1 Methodology

The cumulative traffic impacts from the adjacent IR Projects will be assessed in the revised EIS TIA for B2G.

A review of the indicative project construction schedules and construction routes (as identified for the initial assessments and Draft EIS) will be undertaken to determine whether the proposed construction routes from the other IR Projects (NS2B to K2ARB) are anticipated to use the same road links along the proposed B2G construction routes during the indicative construction timeframe as the B2G Project. Where it has been identified that a spatial and temporal overlap occurs on the proposed B2G construction routes, a cumulative impact assessment will be undertaken as per the methodology outlined below.

The construction traffic volumes for the overlapped construction transport routes from the other IR Projects will be extracted from the initial assessment and Draft EIS stage of these IR Projects. When the EIS TIA is updated during the detailed design phase, updated construction schedules from other IR Projects will be reviewed to reassess any changes to the overlapping construction routes and updates to construction traffic volumes.

Step 1: Compare B2G construction routes with those identified for NS2B, G2H, H2C, C2K and K2ARB and identify road links where there is a spatial and temporal overlap

Step 2: Determine the B2G peak construction traffic volumes for each overlapped road link

Step 3: Determine the construction traffic volumes from other IR Projects for each overlapped road link for the B2G peak

Step 4: Sum the construction traffic volumes for all IR Projects where there is a temporal overlap of construction traffic, based on the identified B2G peak construction period, to form the total construction traffic on each overlapped road link.

A hypothetical example of Step 1 to Step 4 is provided in Figure 1, whereby:

- B2G construction volumes on a nominated link have a temporal and spatial overlap with NS2B, G2H, H2C, C2K and K2ARB volumes
- A peak B2G construction volume of 80 vehicles per day is identified in May 2025
- The cumulative impact for the road link during the B2G peak is identified as 170 vehicles per day, which includes NS2B to K2ARB
- Note this may or may not be to the 'highest' peak for the road link contributed by Inland Rail, as the B2G EIS TIA remains focused on assessing B2G peak periods
- Continue to Step 5 of the methodology.

	Aug-24	Sep-24	Oct-24	Nov-24	Dec-24	Jan-25	Feb-25	Mar-25	Apr-25	May-25	Jun-25	Jul-25	Aug-25	Sep-25	Oct-25	Nov-25	Dec-25	Jan-26	Feb-26	Mar-26	Apr-26	May-26	Jun-26	Jul-26
B2G	10	20	20	30	30	40	40	50	60	80	60	50	40	40	30	20	20	10	10	10				
NS2B		10	20	20	30	30	40	40	50	60	50	40	40	30	20	20	10	10	10	10	10			
G2H															10	10	20	20	30	30	40	40	50	60
H2C									10	10	10	20	20	30	30	40	40	50	50	60	50	40	40	30
C2K								10	10	20	20	30	30	40	40	50	50	60	50	50	40	30	40	30
K2ARB																					10	10	10	20
Total	10	30	40	50	60	70	80	100	130	170	140	140	130	140	130	140	140	150	150	160	150	120	140	140

Figure 1 – Example of Cumulative Construction Traffic Volume

Step 5: 5% comparison of **road link traffic volumes** will be undertaken for the identified B2G construction peak period including any cumulative volumes.

Scenario A: Where the 5% impact threshold is not exceeded during the B2G peak, no further link assessment will be undertaken.

Scenario B: Where the 5% impact threshold is exceeded during the identified B2G peak, assessment will be undertaken in accordance with GTIA including utilisation of Highway Capacity Software (HCS2022) for LOS and road safety assessments.

Step 6: 5% comparison of **intersection traffic volumes** (for all movements) will be undertaken for the identified B2G construction peak period including any cumulative volumes.

Scenario A: Where no traffic movements at the intersection exceeds the 5% impact threshold during the B2G peak, no further intersection assessment will be undertaken.

Scenario B: Where at least one traffic movement at the intersection exceeds the 5% impact threshold during the identified B2G construction peak period, turn warrant, SIDRA intersection assessment and safety review will be undertaken.

Step 7: 5% comparison of **SAR for pavement impacts** will be undertaken for each construction year of the B2G construction peak including any cumulative volumes.

Scenario A: Where the 5% impact threshold is not reached with the cumulated SAR for IR Projects, no further pavement assessment will be undertaken.

Scenario B: Where the 5% impact threshold is reached with the cumulated SAR for IR Projects, the pavement contributions (i.e. marginal cost calculation) will be calculated and planned to be provided to TMR/OCG separately to the EIS TIA, as proposed in the previous ARTC technical memorandums. The assessment will include a breakdown of monetary contribution from each IR Project utilising the B2G road link peak for each proposed construction route.

Safety assessments will be carried out to account for cumulative volumes including any proposed safety improvements and mitigation measures to address the identified safety issues. The safety reviews will be carried out to determine whether the increase in construction traffic volumes from the total IR Projects for the B2G peak have any worsening effects on road safety as outlined in previous ARTC technical memorandums.

2.2 Timing Overlap

Current indicative construction timeframes for the IR Projects between NS2B to K2ARB will be adopted for the purpose of the cumulative assessment. These indicative construction timeframes will allow the best estimation of construction volumes by activities for each IR Project for the corresponding B2G peaks.

2.3 Construction Route Overlap

The following figures provide an indication on the extent of construction route overlaps from some of the IR Projects (between NS2B to K2ARB) on the B2G construction routes.

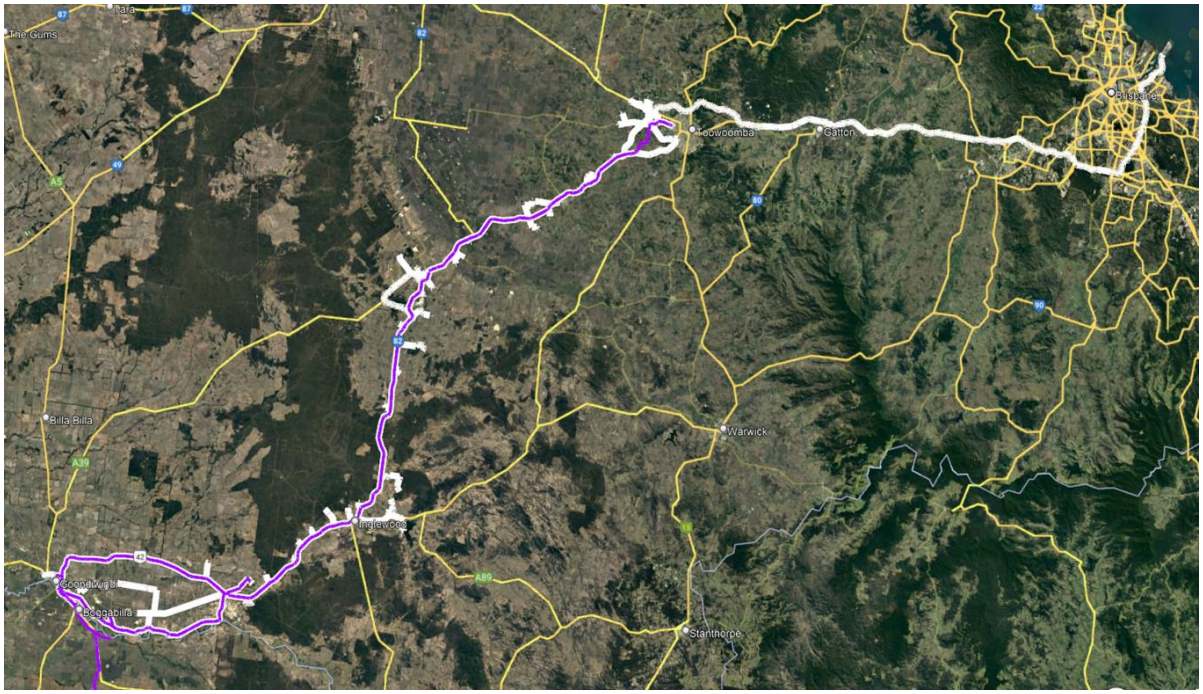

Figure 2 – Construction route overlap from NS2B (purple) on B2G construction routes (white)

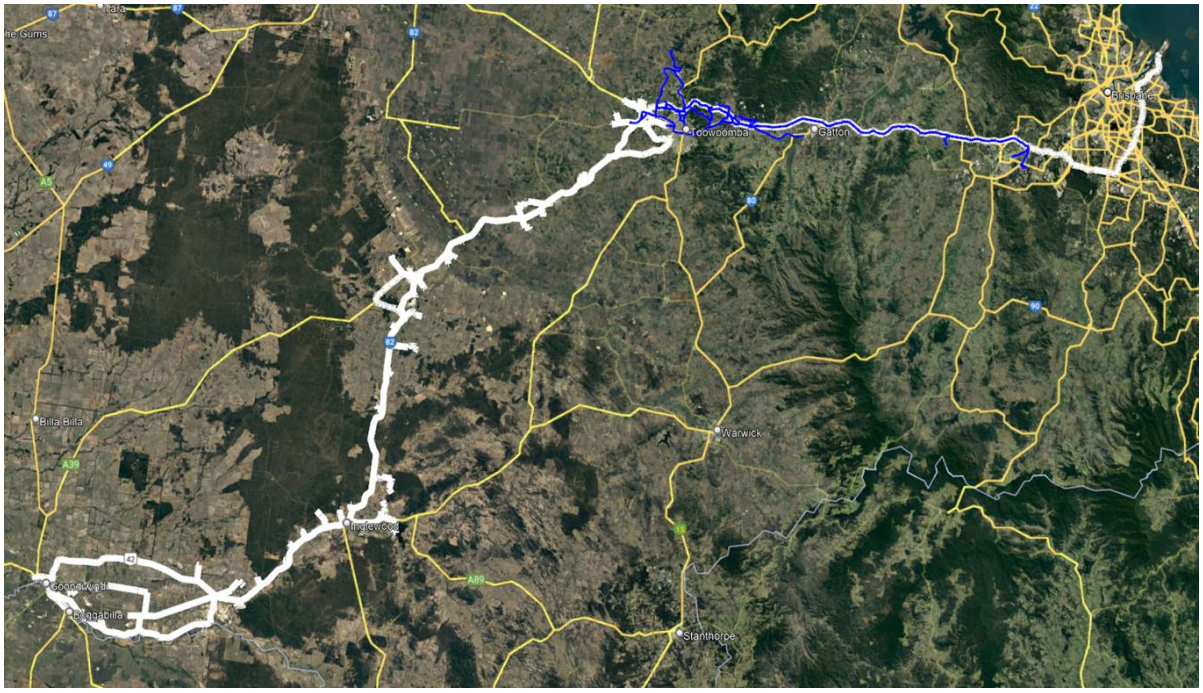

Figure 3 – Construction route overlap from G2H (blue) on B2G construction routes (white)

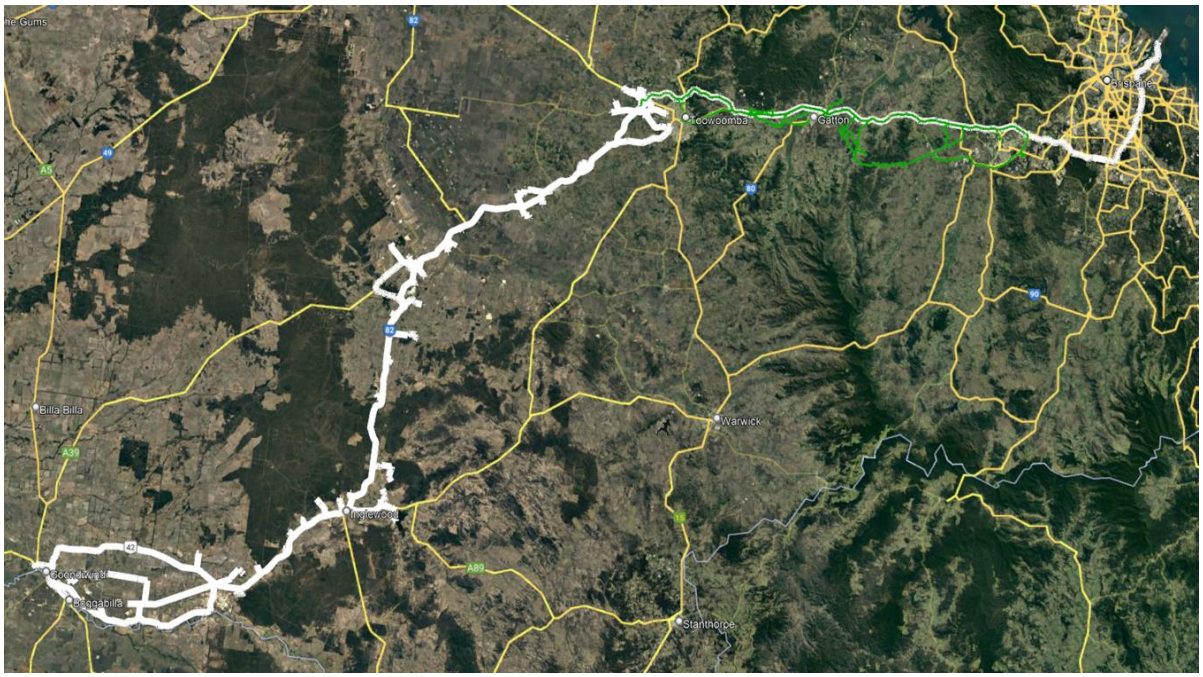

Figure 4 – Construction route overlap from H2C (green) on B2G construction routes (white)

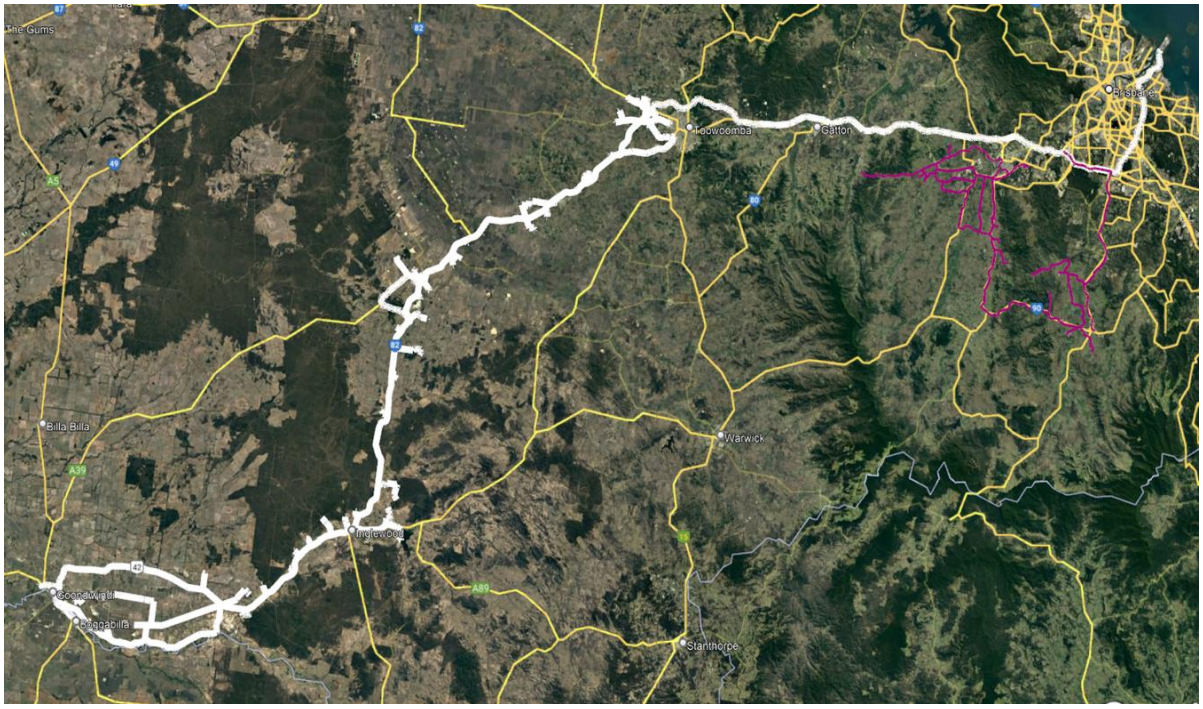

Figure 5 – Construction route overlap from C2K (red) on B2G construction routes (white)

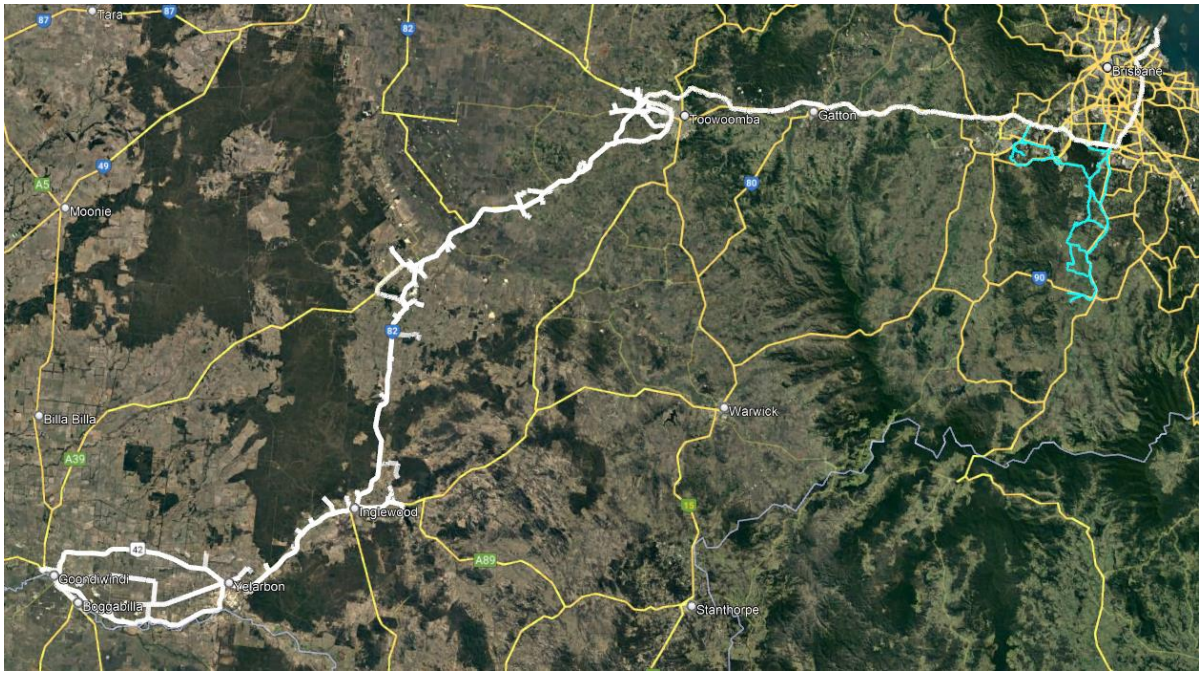

Figure 6- Construction route overlap from K2ARB (light blue) on B2G construction routes (white)

3 Recommendations

The above methodologies will be adopted for the cumulative impact assessments for the B2G revised EIS TIA.

It is reiterated that the general approach of the TIA is to follow the procedures as set out in the GTIA (2018), with this memo provided as a supplement to those procedures.

ARTC believes the proposed methodology provides a best estimate of the additional construction traffic impacts anticipated due to the temporal and spatial overlap of construction activities and the traffic volumes generated by the IR Projects. The proposed methodology assesses the road link, intersection, safety and pavement impacts from the IR Projects. The overlap and subsequent cumulative impacts from other projects will be reviewed in the next project phase as part of further updates to the TIA.

Traffic Impact Assessment

Appendix BR Technical memorandums for TIA methodology to DTMR—pavement impact assessment

BORDER TO GOWRIE REVISED DRAFT ENVIRONMENTAL IMPACT STATEMENT

Inland Rail is a subsidiary of
Australian Rail Track Corporation

INLAND RAIL

Memo

Prepared by	ARTC & FFJV
Prepared for	Ross Cunneen (OCG) and DTMR
Date	16 November 2022
Title	**B2G Pavement Impact Assessment Memo**

1.0 Introduction

The purpose of this memorandum is to clarify the methodology and approach to assessing the pavement impact of increased heavy vehicle movements on the TMR State Controlled Road (SCR) network due to Inland Rail construction activities. It aims to provide guidance at a network level on the type of mitigation strategies (e.g. financial contribution, maintenance of asset during construction or selective reconstruction of asset prior to construction) required for each impacted SCR based on Pavement Impact Assessment (PIA).

1.1 Background

As part of the Traffic Impact Assessment (TIA) for the Border to Gowrie (B2G) Project of Inland Rail, a PIA has been undertaken in accordance with *Guide to Traffic Impact Assessment Practice Note: Pavement Impact Assessment, December 2018 (GTIA, 2018)*. The desired outcome is to ensure a no-worsening to SCR pavements resulting from B2G construction traffic. Noting cumulative impacts will also be assessed using the process described below and in accordance with the Cumulative Impact Assessment Methodology Memo provided to OCG on 21 July 2022.

The GTIA highlights the need for mitigations on sections of the SCR network where the PIA indicates the Standard Axle Repetitions (SARs) have increased by > 5% of the background traffic SARs due to the addition of construction traffic. A summary of the assessment of all impacted SCR's assessed against the background traffic SARs is provided in Attachment 1. It should be noted that all SCRs in this assessment are sealed roads.

A meeting was held between TMR, FFJV and ARTC on 29 June 2022 to discuss SAR assessment criteria and broad impact categories on which mitigation measures should be based. These categories are summarised below:

- 0% to 5% increase in SARs
  - This category requires no mitigation works consistent with Guide to Traffic Impact Assessment Practice Note: Pavement Impact Assessment, December 2018
- >5% to 400% increase in SAR's
  - During the meeting with TMR, FFJV and ARTC on 29 June 2022, TMR Subject Matter Experts (SMEs) advised the financial contribution is linear between 5% and 400% and calculated contribution would be considered appropriate. However, each induvial site should be evaluated in terms of existing condition, ability to withstand construction traffic and likely final condition as well as the required financial contribution.
  - The current maximum % increase across all SCR segments for B2G is 134%.
- Above 400% increase in SARs (noting this category is not applicable to the B2G Project)
  - During the meeting with TMR, FFJV and ARTC on 29 June 2022, TMR Subject Matter Experts (SMEs) advised that the FAMLIT method for financial contribution was not appropriate above 400%. The pavement condition relative to the financial contribution no longer correlated linearly; therefore, the approach to compensation and mitigation was to be developed in collaboration with DTMR on a case-by-case basis.
  - ARTC no longer consider this category or approach necessary for B2G PIA requirements.

Table 1 provides a breakdown of the road segments based on the SAR assessment criteria thresholds mentioned above in each year of construction.

Table 1 Road segments which trigger the specified thresholds by year

CRITERIA THRESHOLD	2024	2025	2026	2027	2028
≤ 5%	158	119	142	173	260
> 5% AND ≤ 400%	107	146	123	92	5

Note: No exceedance greater than 400% threshold.

Maximum SCR segment is 134%.

2.0 Contributions

As part of the TIA, the total pavement contributions calculated based on the B2G construction-related traffic, which has been calculated annually for 100m road segments based on FAMLIT marginal cost information provided by TMR for road segments with impacts greater than 5%.

Table 2 shows the proposed contributions based on the current construction traffic assumptions (refer to PIA Analysis Contributions for more detail).

Table 2 Total Pavement Contributions – Total B2G construction-related traffic summary

VEHICLE	2024	2025	2026	2027	2028	TOTAL
CLASS 5	$415	$18,594	$23,481	$2,564	$0	**$45,053**
CLASS 7	$35,966	$182,992	$68,227	$27,942	$0	**$315,127**
CLASS 9	$18,643	$83,320	$52,069	$23,262	$0	**$177,294**
CLASS 10	$1,231,354	$2,257,875	$1,299,037	$1,255,180	$88,795	**$6,132,241**
OSOM	$0	$1,377	$24,893	$6,257	$0	**$32,527**
TOTAL	**$1,286,377**	**$2,544,158**	**$1,467,707**	**$1,315,205**	**$88,795**	**$6,702,242**

Note: Data was not provided for franchise (Transurban) roads or for Road 18A between Ch 79.260-79.600 km (Road 18A link remains under 5% threshold) and therefore, no contribution calculations were undertaken.

3.0 Maintenance works

It is acknowledged that some of the construction traffic impacts will necessitate maintenance works before or during construction to ensure the road is maintained in a serviceable state. Where ARTC undertakes maintenance activities, negotiations are expected to occur with TMR to discuss compensation as it relates to the total marginal cost contribution.

Intervention limits (i.e. limits beyond which the pavement is considered unsafe or requiring rehabilitation) are to be agreed with TMR prior to the condition assessment. Intervention values for rutting, roughness and maximum deflection (to be determined via Traffic Speed Deflectometer) are to be agreed prior to condition assessment of the SCR's.

4.0 Pavement Recommendation

Agreement of intervention values for condition assessment and assessment of SCRs shall be undertaken by the contractor post EIS approval.

The following mitigation measures are proposed to be applied to the SCRs based on the relevant SAR assessment criteria. Figure 1 provides a simple decision tree on how to select an appropriate mitigation measure for each SCR. No further assessment is required for SCRs that are categorised ≤5% SAR.

The following categories of mitigation measures are proposed based on the outcomes of the condition assessment for SAR increase between 5% and 400%:

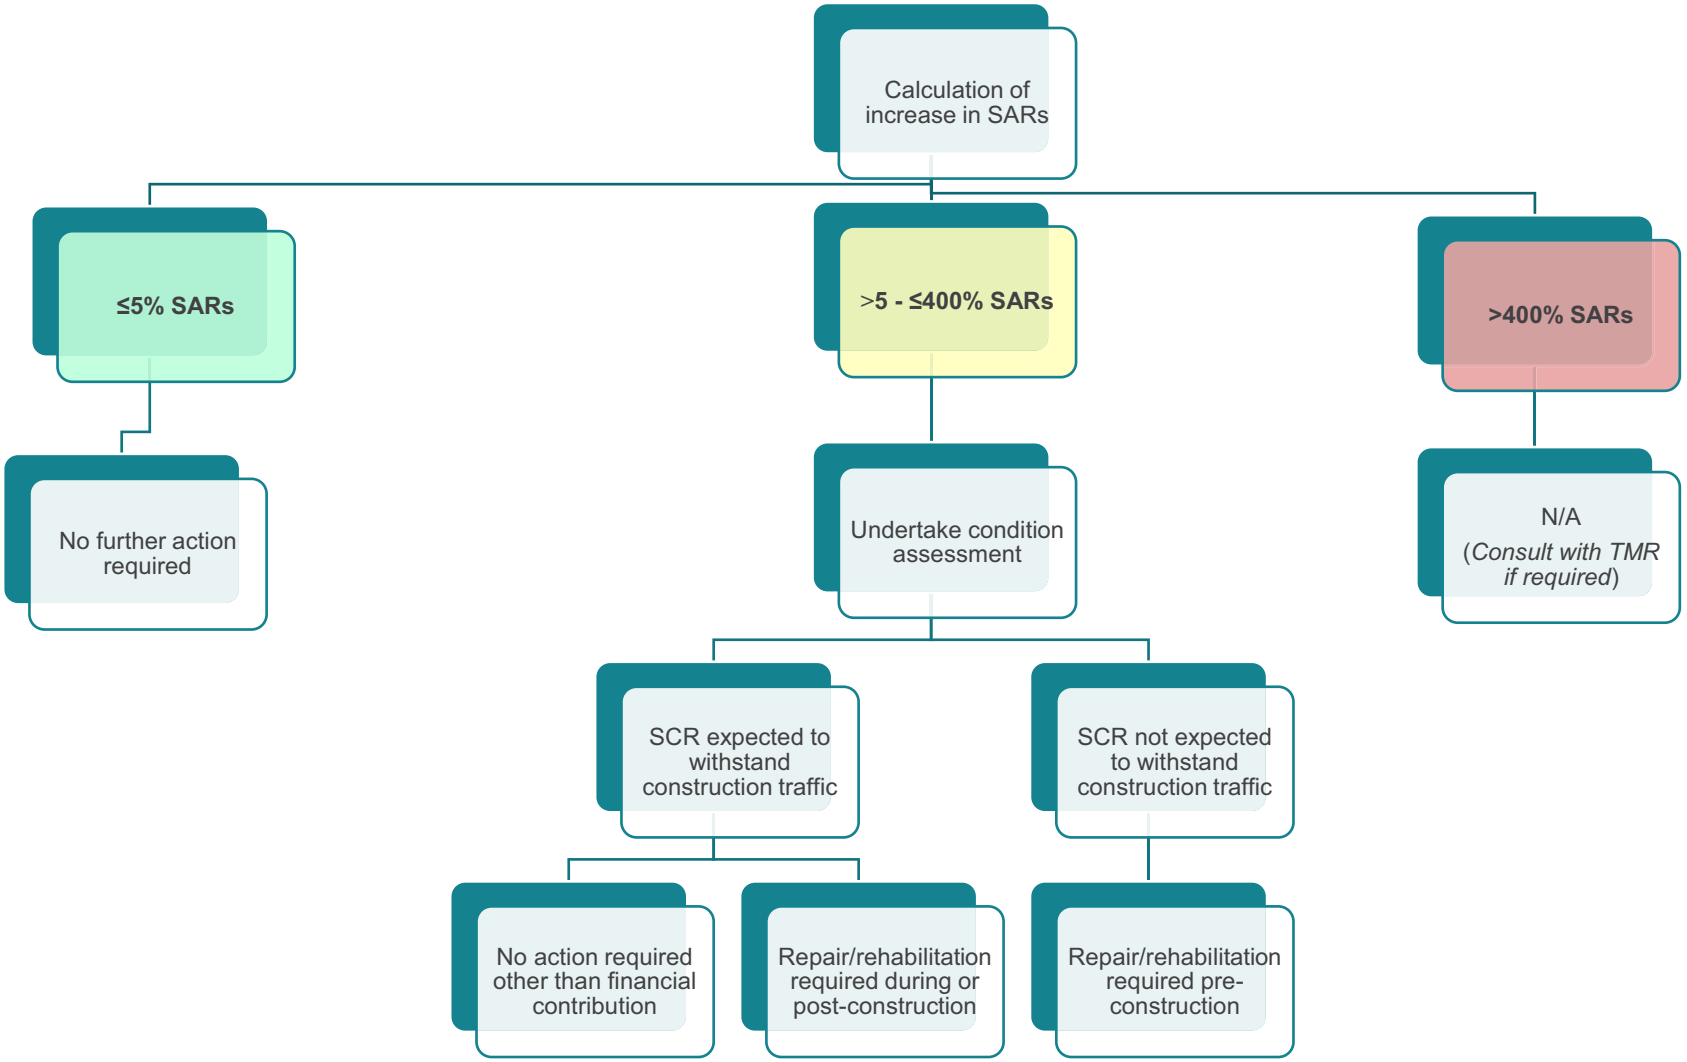
- No action required other than financial contribution
    - The existing pavement is expected to remain in acceptable condition after construction and therefore no pre or post works are anticipated.
    - No works are required and the agreed financial contribution in Section 2.0 is acceptable.
- No action required prior to construction (repair/rehabilitation may be required post-construction)
    - The existing condition of the SCR is sufficient to enable construction traffic and therefore does not warrant any mitigation measure prior to construction.
    - Post construction, if the condition of the pavement is below the agreed intervention values and therefore remedial works will be required.
    - The mitigation methods agreed/adopted during/post construction may exceed the calculated contribution amount provided in Section 2.0.
- Repair/rehabilitation required before construction (maintenance may be required during construction)
    - The existing condition of the SCR is not expected to withstand the proposed construction traffic, thereby requiring works before Inland Rail construction commences.
    - Additional works may also be required during/post construction depending on the deterioration of the SCR.
    - The mitigation action required pre/during/post construction to bring the SCR up to a serviceable level may exceed the calculated contribution amount provided in Section 2.0.

It must be highlighted that the contribution amount does not take into consideration the existing SCR condition and where an SCR is in poor condition, required works are likely to exceed the agreed amount.

The contribution amount should only be considered up to 400% increase in SARs as the current modelling is only valid up to this limit. However, it is noted that no B2G SCR segments are expected to exceed 400%.

Actions for mitigation measures are provided in Section 4.1 for sealed/asphalt roads.

Figure 1 Pavement mitigation decision tree



Note: >400% SARs category is not expected to be required based on current SAR projections.

4.1 Sealed/asphalt roads

Potential mitigation actions that could be adopted pre/during/post construction as per GTIA, 2018 Section 13.3 include:

- A change in surfacing type
- Increase in pavement thickness
- Increasing maintenance for the SCR
- Selective reconstruction with appropriate material. Where failures are evident.
- Total reconstruction

4.2 Further investigations

Subject to the mitigation measures agreed, additional investigation may be required. For example, a geotechnical investigation and traffic counts may be required to provide a pavement design in the event of a pavement upgrade/reconstruction.

5.0 Proposed condition assessments

Consistent with the GTIA, SCRs which experience an increase in SARs of less than 5% are expected to remain within safe and acceptable limits of performance. Therefore, no condition assessment or further mitigation is proposed for these segments.

All SCR segments which have an impact on SARs greater than 5% will have condition assessments in the next phase of the project to determine the appropriate mitigation measure.

6.0 Conclusion

The methodology outlined above briefs TMR on how ARTC plans to mitigate any pavement impacts that the Inland Rail project may have on the SCRs.

After the construction routes have been finalised as part of the detailed design phase, and where necessary, the PIA will be updated to incorporate any changes in assumptions.

The following items should be addressed prior to the next phase of the project:

- Agreement of intervention limits with TMR, relative to existing SCR hierarchy and existing condition.
- Agreement of timeframes of any upgrade/repair works before or during construction
- Agreement of calculated financial contribution.
- Agreement where ARTC undertakes maintenance activities, ARTC and TMR negotiate compensation in good faith as it relates to the total marginal cost contribution.

Memo

To	Ross Cunneen
From	Jason Richard
Date	28 June 2022
Subject	**B2G EIS TIA – Road Safety Methodology**

1 Purpose

ARTC submitted a technical memorandum on their revised approach to the EIS TIA on 6 May 2022. A meeting was held with the OCG and Queensland Department of Transport and Main Roads (TMR) on 13 May 2022 to discuss this technical memo and further comments were provided by the OCG and TMR via email on 9 June 2022. Further information was requested in relation to ARTC's proposed road safety methodology and this memo provides additional detail of our proposed approach.

2 Proposed Road Safety Methodology

Base Data and Area of Impact Assessment

It is proposed to determine the Area of Impact Assessment for road safety primarily consistent with the GTIA requirements, as shown in Figure 1.

Road safety	All intersections where the development traffic exceeds 5% of the base traffic for any movement in the design peak periods[3] in the year of opening of each stage All road links where the development traffic exceeds 5% of the base traffic in either direction on the link in the design peak periods[3] in the year of opening of each stage

Figure 1: GTIA (2018) Table 6.4 extract

In addition to the above, locations which do not exceed the 5% GTIA requirements in Figure 1 will be identified and listed in the EIS TIA. The development traffic percent increase and site-specific input assumptions (e.g. base turning volumes) for each location will be also included. As specifically requested by TMR, example road safety assessments along with typical mitigation measures (if required) at a three leg and a four leg intersection will also be documented in the TIA (design sketches will not be provided for mitigation measures). These will be provided for one T-intersection and one four-way intersection and will be supported by site observations.

Section 2 in the ARTC technical note "B2G EIS TIA – Base Traffic Data and Assessment Methodology" specifies the current base data available and the approach to estimate base traffic data where no count data is available. This approach to base data will also be adopted for the road safety assessment to ensure consistency across all impact assessments for the EIS TIA. As per the comments provided to ARTC by the OCG and TMR via email on 9 June 2022, the proposed approach to base data was acceptable and confirms that no further base data collection is required for the EIS TIA.

Road Safety Assessment Methodology

As per the GTIA, road safety will be considered in two stages as follows:

– Stage 1: Risk assessment and mitigation

As outlined in Section 9.3.2 of the GTIA this is generally a qualitative desktop risk assessment of the likelihood and consequence of safety risks being increased as a consequence of development traffic, pedestrians and cyclists or at the development access points (i.e. construction laydown area access points).

– Stage 2: Safety assessment of proposed design

If any infrastructure works are identified as being required either through the Stage 1 risk assessment or under another impact assessment type (for example, the intersection delay assessment), a road safety audit or road safety assessment will be required (as outlined in Section 9.3.3 if the GTIA) to ensure that the design of the mitigation works does not introduce unacceptable safety risks.

The GTIA definitions of a road safety assessment and road safety audit are shown in Figure 2.

Road safety assessment	An evaluation of safety risks of a future road or traffic project and identification of measures to manage this risk; a road safety assessment is less detailed than a road safety audit
Road safety audit	A formal examination of a future road or traffic project, in which an independent, qualified person reports on its potential safety hazards and identifies remedial measures

Figure 2: GTIA (2018) Definition of Terms (Table 2(a))

For the Stage 1 assessment, road safety risks will be identified and scored using the risk scoring matrix in Figure 9.3.2(a) in the GTIA, for the following scenarios:

– Without development
– With development
– With development and with mitigation measures – for risks that significantly worsen for the 'with development' situation (i.e. from low to medium or from medium to high).

As noted in GTIA, the objective is to recommend mitigation measures that return the risk score back to 'without development' levels and below the 'high' level.

The GTIA notes the types of works to mitigate road safety impacts are infrastructure works such as intersection upgrades, road corridor improvements (i.e. guardrail, lane widening).

An example of a qualitative risk assessment from the GTIA is provided in Figure 3.

Figure 9.3.2(b) – Example risk assessment

	Without development			With development				With development & mitigation		
Risk item	**Likelihood**	**Consequence**	**Risk Score**	**Likelihood**	**Consequence**	**Risk Score**	**Mitigation measures**	**Likelihood**	**Consequence**	**Risk Score**
More left turning traffic at driveway; rear end collision with left turn entry	1	2	L	2	2	L	No action			
More right turn out movements into 4 lane road with no median storage	1	3	L	3	3	M	Widen median to allow two-part right turn	1	3	L
Right turn pocket of adjacent intersection queuing out into 80kph traffic; rear end crash	1	5	M	3	5	H	Extend right turn pocket to accommodate queues	1	5	M
Poor sight distance for right turns out of the access due to heavily planted frontage; potential for right-through crashes with vehicles, cyclists and pedestrians.	4	4	H[1]	5	4	H	Remove or trim foliage to provide adequate sight distance	2	4	M

[1] Even though the risk score has not changed with the development, this existing safety issue needs to be mitigated to lower the score below the 'high' level.

Figure 3: GTIA (2018) Example Risk Assessment (Figure 9.3.2(b))

The Stage 1 assessment will be completed for intersections, including road-rail interfaces and road links that satisfy the GTIA requirements in Figure 1 for operational and construction project (development) traffic. As part of the Stage 1 assessment, site observations will be undertaken for key intersections where over-size over-mass (OSOM) movements are present (e.g along bridge girder and rail track construction traffic routes). Site observations will also be carried out at laydown access locations on local roads with a posted speed limit of 80 km/h or greater and all state-controlled roads.

The Stage 2 assessment will only be considered at locations where upgrade works are required as an outcome of the Stage 1 assessment or under another impact assessment (i.e. intersection delay assessment). There are two levels of assessment for this stage:

- Road safety assessment
- Road safety audit

Tables 9.3.3(a) and 9.3.3(b) in the GTIA defines the level of assessment required.

As stated in the GTIA where a road safety audit has been identified as being required, concept design plans / sketches of the proposed works will be required as a basis for the road safety audit.

It is anticipated that the majority of Stage 2 assessments for construction traffic impacts will be at access locations for construction laydown areas. It is expected that the TIA will consider Stage 2 assessments at these locations. However, the number of locations where infrastructure works to accommodate construction traffic is expected to be minimal.

Road safety audits for the permanent road changes for the project design, not necessitated by results of the EIS TIA, will be undertaken as part of the road design development process separate to the EIS TIA.

Where a road safety audit is required, the audit will be undertaken by TMR accredited road safety auditors who are independent of the design team. A Feasibility Stage road safety audit will be undertaken in accordance with Austroads Guide to Road Safety Part 6: Road Safety Audit (AGRS06-19) and the TMR Supplement to TRUM Volume 2: Guide to Road Safety, Part 6: Road Safety Audit. Where a road safety assessment is required, this will be undertaken by the FFJV team.

The EIS TIA will also assess any existing level crossings within an impact assessment area in accordance with GTIA Section 14.

Australian Rail Track Corporation

INLAND RAIL

Public level crossing treatment methodology

Introduction

The key principles guiding the decision-making process for determining treatments at public road–rail interfaces include:

- Using a risk-based decision-making process focused on minimising risk So Far As Is Reasonably Practicable (SFAIRP)
- Consistency in the determination of road–rail interface treatments across all projects of the Inland Rail Program
- Applying a consistent methodology to determine if the cost of the potential available treatment is grossly disproportionate to the level of risk to safety and the projected benefits
- Working with stakeholders to minimise the number of level crossings across the Inland Rail Program
- Ensuring the feasibility of the Inland Rail Program by proposing cost-effective solutions.

An overview of the process followed in the assessment of road–rail interfaces across the Border to Gowrie (B2G) project and the methodology followed in the development of road–rail interface treatments is outlined below.

Process overview—determination of road rail interface treatments

Identification of all potential road–rail interfaces within the proposal site

An important objective of level crossing investigations is the clear and accurate identification of all road-rail interfaces within the proposal site. The list of identified road–rail interfaces is then provided to the relevant road manager for review in order to ensure that all interfaces and the associated road infrastructure managers have been correctly identified.

Identify opportunities to minimise the number of proposed road–rail interfaces

The initial focus is on identifying opportunities to eliminate road-rail interfaces by assessing all existing and proposed crossings for removal. Options to eliminate crossings include road closures, road diversions or realignments, existing level crossing closures and grade separations.

This approach is consistent with Queensland Level Crossing Safety Strategy which notes that organisations should "explore opportunities for grade separation or closing level crossings and seek to minimise any proposals to construct a public level crossing on a greenfield site".

Any proposed changes to the road network are developed in consultation with the relevant road manager.

Review whether the road–rail interfaces meet the criteria for automatic grade separation

ARTC's policy is that rail-road interfaces will be automatically grade separated in the following three instances:

1. Rail-road interfaces with four rail tracks (current)
2. Rail-road interfaces of freeways and highways of four or more lanes (current and committed future plans) or limited access roads
3. Where grade separation is the logical option for topographical or other technical engineering reasons.

All other crossings will be assessed using the Inland Rail Level Crossing Risk Tool.

Inland Rail Level Crossing Risk Tool

Where a road–rail interface is required, ARTC apply a consistent safety-based risk approach to determine crossing treatments. This is the Inland Rail Level Crossing Risk Tool.

The approach uses the Australian Level Crossing Assessment Model (ALCAM) as one of the main inputs into the decision process. ALCAM is the only nationally accepted risk tool for level crossings and has been endorsed by state and territory ministers. ALCAM considers a range of factors including:

- Future road traffic volumes
- vehicle types
- future train volumes
- road and rail vehicle speeds and lengths
- Sighting and stacking distances.

All road traffic inputs used in the assessment are reviewed by the relevant road manager.

The Australian Transport Council in May 2003 agreed to adopt the Australian Level Crossing Assessment Model (ALCAM) as the only comprehensive level crossing assessment model in Australia. ALCAM is an assessment tool used to identify key potential risks at level crossings and assess the overall effects of proposed treatments.

This quantitative risk-based approach used to determine road-rail interface treatments across the Inland Rail alignment is consistent with the Office of the National Rail Safety Regulator (ONRSR) guidelines on risk assessment.

ONRSR is a national regulator which was created to administer and regulate the safety of the Australian railway industry under Rail Safety National Law (RSNL)

In June 2020, ONRSR finalised an audit of the *Inland Rail Road–Rail Crossing Strategy*. The audit recognised a consistent, systematic and comprehensive process for the assessment of level crossings is applied to determine adequate treatments, noting that the approach ensures level crossing safety risks are eliminated or minimised, SFAIRP. There were no findings or recommendations identified by the audit requiring action by ARTC.

Section 10 of ONRSR's *Policy on Level Crossings* (ONRSR, 2019) provides support for the use of ALCAM as follows:

> *'ONRSR accepts the use of ALCAM as a tool to help prioritise investment (when used in conjunction with other relevant factors, such as recent occurrence history). This tool has been endorsed by state and territory ministers.'*

Consideration of factors other than ALCAM that may influence the recommended level of control are also taken into account, where relevant, on a case-by-case basis, including:

- Collision and near-collision history
- Traffic and transport impacts
- Future developments
- Local knowledge of driver or pedestrian behaviour.

The assessment incorporates a compliance check against *AS1742.7-2016 Manual of uniform traffic control devices, Part 7: Railway crossings* (Standards Australia, 2016).

Level crossing treatment (control) options considered as part of the process include:

- Installing/upgrading passive (stop sign) level crossings—compliant with AS1742.7-2016
- Installing/upgrading to active level crossings (flashing lights and boom barriers)
- Elimination of crossings via road closures, diversions, or realignments
- Grade separation
- Other treatments identified based on-site specific risks.

Active controls are where a device, such as flashing lights or boom barriers, is activated prior to and during the passage of a train through the level crossing.

From a futureproofing perspective, 2040 road and rail traffic volumes are used in determining crossing treatments.

Any proposed changes to the road network are subject to review by the relevant road authority.

Cost benefit analysis

Part of the test as to whether risks have been managed SFAIRP is to determine whether the cost of the additional control is grossly disproportionate to the benefit gained via a CBA. From a financial perspective, three key inputs are required for the CBA:

1. *The avoided cost if an additional risk control is implemented (Value of Life * risk reduction)*—the risk tool relies on ALCAM, which provides a quantitative measure of risk, which also enables the modelling of risk reduction generated by changing the controls at the level crossing. Risk reduction (benefits) can be calculated by comparing two risk scores for two scenarios, e.g. one level crossing with stop signs and one with flashing lights and boom barriers. ARTC have adopted the Australian Government, Department of Prime Minister and Cabinets value of life number. The Level Crossing Risk Tool is updated whenever the Australian Government revise this number.
2. *The cost of implementing the additional risk control*—this is a combination of the capital cost of the additional control and the annual maintenance and repair cost over the life of the additional control.
3. *What would be considered grossly disproportionate*—from a legal perspective, the ONRSR *Meaning of Duty to Ensure Safety So Far As Is Reasonably Practicable Guideline* provides some guidance on what would be considered grossly disproportionate—the 'Grossly Disproportionate Factor' or GDF. The guideline suggests that the GDF may be dependent on the likelihood and consequence, with low risks having a factor of 2 and high risks having a factor of 10. The Level Crossing Risk Tool was initially developed to apply a GDF of 7. The risk tool was revised to adopt a more conservative GDF of 8. Where the GDF for grade separation is less than 8, ARTC undertakes additional assessments including development of site-specific estimates to a sufficient level of detail to enable a decision to be made on whether the grade separation is reasonably practicable

The use of ALCAM assessments in the determination of level crossing treatments

ALCAM assessments are undertaken for all proposed public road level crossings in the proposal site, thus providing a baseline risk score. ARTC use qualified design consultant to inform the inputs into the IR Level Crossing Risk Tool. These inputs are then validated by both internal ARTC subject matter experts and independent ALCAM consultants. The proposal functionality in the ALCAM system is used to model what the ALCAM risk score would be, assuming the introduction of Inland Rail. This incorporates forecast train speeds, volumes and train lengths. Updated road traffic counts, including a breakdown between light are heavy vehicles, are also collected for all public roads and included in this analysis.

If a crossing is assessed as being non-compliant for a passive stop sign control, the next level of control is applied. For example, if, based on the updated train speeds, sufficient sighting distance for a stop sign crossing as per *AS 1742.7-2016 Manual of uniform traffic control devices Part 7: Railway crossings* (Standards Australia, 2016) cannot be achieved, then the minimum control is flashing lights and boom barriers.

Even when a crossing is compliant for a passive stop sign control, the next level of control is modelled in ALCAM and a cost benefit/GDF analysis is undertaken, until the risk factor is reduced and a cost-effective level of crossing protection is established. For example, a passive control would be compared to a boom barrier control, which would then be compared to a grade separated control.

Preliminary design

A preliminary level of design is first undertaken to confirm that a level crossing with the proposed control, which complies with the relevant standards, can be constructed. This design incorporates any road design standards that

have been provided by the relevant road infrastructure manager.

Site-specific level crossing treatments are then reviewed with the respective road infrastructure managers as the project progresses through the design process.

Interface agreements

In accordance with section 105 of l Rail Safety National Law (RSNL), ARTC will seek to enter into Interface Agreements for all current and proposed public road crossings in order to assist in the management of safety risks at level crossings once the rail line is operational.

Interface Agreements include:

- Risk Management and
- Ongoing Management of the infrastructure including scenarios such as maintenance works, emergency works or where there is a material changes to the usage of the interface

The typical review period for Interface Agreements is 5 years or at other times agreed by the parties.

Conclusion

The objective is to develop a consistent methodology in the selection of level crossing treatments that is acceptable to key stakeholders and minimises risk SFAIRP.
