Executive summary

Objectives

The purpose of this report is to detail the implementation of the Sediment Characterisation Plan and characterise ambient geochemical baseline conditions in terms of sediment character at the potential dredged material placement areas (DMPAs) within Port Curtis. Only sediments below the highest astronomical tide were assessed during the Project geochemical investigation as upper intertidal and terrestrial portions of the DMPAs will be assessed during a separate investigation.

The objectives of the Project geochemical investigation are:

- Undertake sediment sampling, analysis and reporting in accordance with the approved Sediment Characterisation Plan
- Analyse the sediments within the DMPAs for a range of physical and chemical parameters, and compare contaminant concentrations against the National Assessment Guidelines for Dredging 2009 (NAGD) and other relevant guideline criteria
- Characterise the ambient geochemical baseline conditions of each DMPA to assist in assessing the suitability of each DMPA to receive dredged material from the Port of Gladstone Gatcombe and Golding Cutting Channel Duplication Project
- Support the Environmental Impact Statement for the Project.

Methodology

The site investigation was carried out within the DMPAs by Aurecon Australasia Pty Ltd (Aurecon) in accordance with the approved Sediment Characterisation Plan (refer Appendix A), NAGD (2009) requirements, relevant legislation, standards and guidelines. The geochemical investigation was undertaken between 2 February and 28 February 2015 with additional sampling conducted during the Project geotechnical investigations.

A total of 99 locations within the Project DMPAs were drilled and assessed during the investigation, including:

- East Banks Expansion DMPA (at sea):
  - 36 boreholes
- West Banks Island DMPA:
  - 27 boreholes
  - 2 boreholes (geotechnical)
- Port Central Expansion DMPA:
  - 11 boreholes
  - 2 boreholes (geotechnical)
- Western Basin Expansion DMPA:
  - 21 boreholes.

A vibrocorer, operated by Seas Offshore aboard the vessel “Shackleton”, was used to collect sediment cores at 95 locations. A hand-held GPS device was used to position the vessel within 10m of each sample location. Sediment cores were cut into 1.0m lengths, split horizontally, photographed and logged prior to sampling.

Sediment samples were also taken at four additional locations within West Banks Island DMPA and Port Central Expansion DMPA in the underlying consolidated natural geological materials. This was done in conjunction with the geotechnical investigation drilling undertaken using the Ocean Driller II jack-up barge, between 9 March and 4 May 2015.

The primary analysis of sediment samples was conducted by ALS Environmental with Eurofins as the secondary laboratory to analyse inter-laboratory duplicate samples. Both laboratories are National Association of Testing Authorities (NATA) accredited for the analytical methods used.

Results

Where guideline value exist under NAGD (2009), an assessment against these was undertaken. Where no values are present under NAGD (2009), a comparison against locally derived reference values and other locally derived reference data (equivalent to the NAGD (2009) term regional ambient baseline levels) was undertaken.

Generally, the chemical composition across all four DMPAs demonstrated very few exceedances of the NAGD (2009) screening levels for contaminants of concern, including metals, metalloids and organics. All sites showed similar characteristics in having low levels (i.e. greater than laboratory limit of reporting but lower than NAGD screening levels or background value) of several metals, including arsenic, chromium, copper, lead, nickel, selenium, vanadium, zinc and mercury.

The distribution of these contaminants of concern (and observed exceedances) was ubiquitous throughout the sediment profile sampled and the spread was across the four DMPAs indicating that the metals are widespread and naturally occurring.

Dioxin concentrations detected across Port Curtis were below the Dutch Intervention Levels and the Canadian sediment quality guidelines. In addition, dioxin concentrations were consistent with previous testing undertaken by Department of Environment and Heritage Protection (EHP) in 2012 and were typical of estuaries around Australia when compared with the National Dioxins Program (Müller et al. 2004).

The presence of acid sulfate soils (ASS) varied between the DMPAs. Samples from East Banks Expansion DMPA and West Banks Island DMPA did not contain actual ASS and sediments are unlikely to contain potential ASS, mainly due to the higher proportion of sand at these locations. At Port Central Expansion DMPA, acidity was detected within some samples at depths of 0.5m and greater. At Western Basin Expansion DMPA, ASS was widespread throughout the site both laterally and vertically.

Conclusions

Geochemical results from this investigation have demonstrated that the sediment from the DMPAs have low concentrations of metals throughout the sediment profile, and despite the exceedances of screening levels for some contaminants in some samples, overall, the sediment would be considered **clean** as per NAGD (2009).

Given the sediments from the area to be dredged are also **clean** as per NAGD (2009), as reported in the Sampling and Analysis Plan Implementation Report (area to be dredged) (Aurecon 2015), the DMPAs are considered to be chemically suitable to receive dredged material from the area to be dredged. Further testing such as elutriates and bioavailability testing is not required.

The appraisal of laboratory and field QA/QC procedures and assessments indicates that the results comply with the NAGD (2009) requirements. The analytical results are therefore representative of the physical and chemical characteristics of the sediment.

Compliance of the Project geochemical investigation with the approved Sediment Characterisation Plan and NAGD (2009) is demonstrated by:

- Drilling and sampling has been undertaken to a full depth of sediment that has the potential to be contaminated and is considered to have potential to interact with the dredged material or be disturbed during reclamation bundwall construction or dredged material placement. The vibrocorer achieved refusal in consolidated natural geological materials (i.e. rock, dense sands/gravels or stiff to very stiff clays).
- Sampling used a vibrocoring process, a NAGD recognised approved device for undertaking geochemical sampling
- Additional sediment sampling and laboratory analysis for metals and metalloids was undertaken in the underlying consolidated natural geological materials, in conjunction with the geotechnical investigation in four additional locations (two locations in West Banks Island DMPA and two locations in Port Central Expansion DMPA) to collect information on metals and metalloids that have previously been demonstrated to be naturally occurring within Port Curtis.

1 Introduction

1.1 Background

The Port of Gladstone is located along the Capricorn Coast of Central Queensland, approximately 525km north of Brisbane. The outer Port limits extend east of Port Curtis, past the adjoining Curtis and Facing Islands. The southern Port limits extend to the northern tip of Hummock Hill Island, near Tannum Sands, and the northern Port limit is located within the upper sections of an estuarine passage known as The Narrows. The main shipping channel to the Port enters at the southern extent, through the Boyne River estuary, and onto Fisherman's Landing.

The Port of Gladstone is Queensland's largest multi-commodity port, with RG Tanna Coal Terminal in the 2013/14 reporting period being the world's fourth largest coal export terminal (by throughput) in the world. Cumulatively, the Port handles the export of mineral resources from Central Queensland and products from local industries, and the import of raw materials from national and international sources (GPC 2014).

The Port of Gladstone is also one of the busiest ports in Australia, vital to the local, state and national economies. Major exports from the Port include coal, alumina, cement, petroleum, aluminium and agricultural resources.

Gladstone Ports Corporation (GPC) is responsible for the control and management of port infrastructure and cargo handling operations for coal and other products at the Port of Gladstone, Port of Rockhampton and Port of Bundaberg. GPC provides and maintains vital shipping channels within the Port and is responsible for the development, management and leasing of Strategic Port Land (SPL). GPC is also directly responsible for road infrastructure, pilotage services, towage services (through an exclusive licence), property services on SPL, community parklands, quarantine and waste disposal services and the Gladstone Marina.

GPC has identified the need to duplicate the existing Gatcombe and Golding Cutting shipping channels to accommodate a predicted increase in shipping traffic as a result of ongoing industrial growth within the Port. The duplicate channels are proposed to be developed adjacent to the existing shipping channel, facilitating two-way shipping traffic from the outer harbour.

1.2 Environmental impact statement

The proposed Gatcombe and Golding Cutting Channel Duplication Project (herein referred to as 'the Project') was declared a 'coordinated project' by the Queensland Coordinator-General (CG) under the *State Development and Public Works Organisation Act 1971* (SDPWO Act) on 25 September 2012. The Project was also determined to be a 'controlled action' requiring an Environmental Impact Statement (EIS) by the Commonwealth Minister for the Environment under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) on 23 October 2012.

GPC is currently proceeding with the EIS phase of the Project. The EIS will be submitted for assessment to both the Queensland State Government under the SDPWO Act and the Commonwealth Department of the Environment (DoE) under the EPBC Act. The Project originally had the potential to undertake activities (e.g. placement of dredged material within the Great Barrier Reef Marine Park (GBRMP) which are assessable under the *Great Barrier Reef Marine Park Regulations 1983* (GBRMP Reg).

1.3 Dredging and dredged material placement

1.3.1 Dredging

The dredging component of the Project involves the duplication of the existing Gatcombe and Golding Cutting shipping channels that will be parallel to provide a duplicate channel parallel to the main shipping channel, facilitating two-way passage. The location of the area to be dredged as part of the Channel Duplication Project are shown in Figure 1.1.

The proposed duplicate channel will be approximately 14km long and dredging is proposed to be undertaken to an ultimate depth of -16.1 metres (m) lowest astronomical tide (LAT), with a channel width (toe to toe) of 200m (refer Figure 1.1). The channel area is approximately 382 hectares (ha), however, due to the existing bathymetry in the Port of Gladstone, the total area requiring dredging (i.e. above -16.1m LAT) is less, being 247.8ha. This equates to approximately 12.6Mm^3 of seabed material (including dredging tolerance) requiring removal and placement during the project.

Two dredging and placement campaign options are proposed and will be selected upon availability of dredging equipment and operations within the Port of Gladstone. The likely volumes and timing of each campaign option are outlined in Table 1.1.

Table 1.1 Dredging campaign and staging options, location and volumes

Stage	Location	Timeframe – likely start date or later (duration)	Design depth (m LAT)	Volume (Mm^3)*	Disturbance area to be dredged (ha)
Option 1 – two staged dredging campaign					
1	Gatcombe and Golding Cutting Channels	Q4 2018 or later (12 months)	-13.5	7.25	179.6^
2	Gatcombe and Golding Cutting Channels	2022 or later (8 months)	-16.1	5.35	247.8
Option 2 – one stage dredging campaign					
-	Gatcombe and Golding Cutting Channels	Q4 2018 or later (20 months)	-16.1	12.6	247.8

Table notes:
* Includes 0.3m (depth) allowance for average dredging tolerance
^ Different disturbance area to be dredged as part of Option 1, Stage 1 is due to some parts of the channels already being equal to or deeper than -13.5m
Q4 = fourth quarter of a calendar year (i.e. October to December)

There is the potential for the commencement of dredging to be after 2018, subject to actual and predicted Port throughput and associated vessel movements over the next 5 to 10 years.

1.3.2 Dredging methodology

The dredging methodology adopted for the Project will be subject to the Maritime Safety Queensland (MSQ) Regional Harbour Master acceptance of the successful dredging contractor's detailed execution plan. The dredging contractor will also comply with MSQ's Standard for Marine Construction Activities within Gladstone Harbour (DTMR 2012).

Sediment Characterisation Plan Implementation Report (DMPAs)

Figure 1.1: Channel Duplication location and Dredged Material Placement Options

A combination of different dredging vessels are likely to be used for the Project, including:

- Trailing suction hopper dredger (TSHD)
- Cutter suction dredger (CSD).

The preferred method of dredging and size/capacity of the dredger equipment are dependent on a number of factors, which will have implications on how the material can be dredged, transported and placed at the preferred dredged material placement location, including:

- Design of the area to be dredged
- Nature of material to be dredged (e.g. the stiffness of material)
- Quantities of materials to be dredged
- Depth of water (i.e. to maintain the vessel's required underkeel clearance)
- Sea conditions (e.g. wind, waves, currents)
- Environmental considerations
- Distance, availability and accessibility of dredged material placement location
- Maintaining navigability of existing shipping channels
- Required schedule
- Equipment availability.

1.3.3 Dredged material placement

This investigation assessed four potential dredged material placement areas (DMPAs), which are outlined in Table 1.2 and presented in Figure 1.1, and include:

- East Banks Expansion DMPA – at sea placement within Port limits
- West Banks Island DMPA – island reclamation
- Port Central Expansion DMPA – land based and intertidal reclamation
- Western Basin Expansion DMPA – intertidal reclamation.

Table 1.2 Summary of potential DMPAs

DMPA	Placement type	Location
East Banks Expansion DMPA	Offshore (at sea)	Within Port limits and outside the Great Barrier Reef Marine Park (GBRMP) and extends from the boundary of the existing East Banks DMPA to the north, east and west
West Banks Island DMPA	Island reclamation	Between Boyne Island and the Gatcombe Channel, to the south of the existing shipping channel. Southeast of the South Trees Wharves and Boyne Wharf.
Port Central Expansion DMPA	Land based and intertidal reclamation	South of the existing Barney Point Wharf and Coal Terminal, the Barney Point residential area of Gladstone and north of QAL located at Parsons Point. It is to the south of the existing Auckland Channel and north of South Trees Wharves.
Western Basin Expansion DMPA	Intertidal reclamation	North of the existing Western Basin reclamation area and south of the Narrows

For Port Central Expansion DMPA, only the sediments below highest astronomical tide (HAT) were assessed during the Project geochemical investigation. The sediments and soils within the area above HAT (i.e. the upper intertidal and terrestrial portions of the DMPA) will be assessed during a separate investigation.

Further information on the potential DMPAs is provided in the Sediment Characterisation Plan (Appendix A).

1.4 Purpose of this report

A Sediment Characterisation Plan (SCP) has been approved by the Commonwealth DoE and the Queensland Department of Environment and Heritage Protection (EHP) and is provided in Appendix A.

The purpose of this report is to detail the implementation of the SCP and characterise ambient geochemical baseline conditions in terms of sediment character at the potential DMPAs. The objectives of the sediment investigation are:

- Undertake sediment sampling, analysis and reporting in accordance with the approved SCP
- Analysis of the sediments within the DMPAs for a range of physical and chemical parameters, and comparison of contaminant concentrations against the National Assessment Guidelines for Dredging 2009 (NAGD) and other relevant guideline criteria
- Characterise the ambient geochemical baseline conditions of each DMPA to assist in assessing the suitability of each DMPA to receive dredged material from the Project
- Support the EIS for the Project.

A separate implementation report has been developed to assess the geochemical characteristics of the sediments within the proposed area to be dredged.

A comparison between the geochemical characteristics of the material to be dredged and its suitability for placement at each of the DMPAs will be conducted during the impact assessment phase of the EIS.

1.5 Sediment investigation framework

1.5.1 Summary

The assessment of Project data has been undertaken in a staged process. This is to comply with NAGD (2009) where a contaminant does not have a screening level and to account for placement of dredged material in a reclamation. The sediment investigation framework staged process included:

- A compliance assessment undertaken for potential contaminants of concern, where guideline values exist under NAGD (2009)
- Where no guideline values exist under NAGD (e.g. iron), a comparison against locally derived reference values and other locally derived reference data was undertaken. This is in compliance with the NAGD (2009) requirement that where contaminants are identified for which there are no Screening Levels, these contaminant concentrations should be compared against regional ambient baseline levels.
- A comparison against terrestrial background values, such as QLD Draft Guidelines for the Assessment & Management of Contaminated Land in Queensland (both background and EILs), Australasian Institute of Mining & Metallurgy (background range) and the Dutch Intervention Levels was undertaken.

Further detail is provided in the sections below.

1.5.2 Guidelines

Where guidelines values exist, such as NAGD (2009), a compliance assessment against these guideline values will be undertaken.

1.5.2.1 National Assessment Guidelines for Dredging (NAGD)

The objective of the NAGD (2009) is to apply a regulatory framework to ensure the impacts of dredged material loading and dredged material placement are adequately assessed and, when offshore dredged material placement is permitted, that impacts are managed responsibly and effectively.

Where NAGD (2009) provides guideline values for potential contaminants of concern, an assessment of the data will be undertaken against these values.

NAGD (2009) provides screening levels for a range of contaminants, based on the interim sediment quality guidelines (ISQGs) developed by ANZECC/ARMCANZ (2000) and updated by Simpson et al. (2008; 2013). If the 95% upper confidence limit (UCL) of a contaminant exceeds the specified screening level, it is considered a contaminant of potential concern and requires further investigation.

Where contaminants exceed the Sediment Quality Guidelines – High (SQG – High), the sediment is considered to be significantly contaminated with a consequent risk of bioaccumulation in invertebrates. In this instance, bioaccumulation testing will be required.

1.5.3 Locally derived reference values

NAGD (2009) states that where contaminants are found for which there are no Screening Levels, these contaminant concentrations should be compared against regional ambient baseline levels. The sections below summarise existing locally derived reference values for Port Curtis, which are consistent with NAGD (2009) defined regional ambient baseline levels.

1.5.3.1 Port Curtis Integrated Monitoring Program

The Port Curtis Integrated Monitoring Program (PCIMP) was established in 2001 as a consortium of members from 16 bodies representing industry, government (both local and state), research institutions and other stakeholders to develop a cooperative, monitoring program for assessing the ecosystem health of Port Curtis, and to ensure the environmental sustainability of the Port of Gladstone.

To help assess the ecosystem health of Port Curtis, sediments were sampled every three years by PCIMP (2011). Water quality was assessed more frequently as contaminants in sediment are less dynamic than those in water and are therefore unlikely to change in the short term. Samples were analysed for metals and nutrients with results used as a background measurement for ecosystem health within Port Curtis.

The ecosystem health (EH) values for sediment were derived from the 95th percentile of background data collected during the PCIMP monitoring and the worst case scenario (WCS) values are 10 times the EH values (PCIMP 2011). The PCIMP EH values have been adopted by this investigation as locally derived reference values where no NAGD (2009) screening levels are provided.

1.5.3.2 Metal Concentrations in the Waters and Sediments of Port Curtis, Queensland

Angel et al. (2012) conducted an investigation of water and sediment quality within Port Curtis on behalf of the Commonwealth Scientific and Industrial Research Organisation (CSIRO). Results were collected from 6 to 8 December 2011 from 21 sites within the general area of Port Curtis, the southern Narrows and Rodds Bay, with more detailed sampling in the vicinity of Western Basin and the liquefied natural gas (LNG) facilities (Angel et al. 2012). Samples were collected from the surface sediments using a stainless steel Van Veen grab sampler.

Results from this investigation have been adopted as locally derived reference values where no NAGD (2009) screening levels are provided, including aluminium, iron, cobalt, manganese, selenium and vanadium.

1.5.3.3 Report for Western Basin Dredging and Disposal Project – Sediment Quality Assessment

GHD (2009a) conducted the sediment quality assessment for the Western Basin Dredging and Disposal Project (WBDDP). Sampling was conducted within the Western Basin area between 16 November 2008 and 17 June 2009 using a combination of vibrocoring, push tubes, standard

penetration tests and rotary drilling methods. Boreholes were drilled to various depths, ranging from -5.3m LAT to -22.4m LAT, and over 1,000 sediment samples were collected (GHD 2009a).

Results from this investigation have been adopted as locally derived reference values where no NAGD (2009) screening levels are provided, including aluminium, iron, cobalt, manganese, selenium and vanadium.

1.5.3.4 National Dioxins Program

There are no guideline values for dioxins or dioxin-like chemicals in sediments in Australia. However, under the National Dioxins Program (Müller et al. 2004), 75 sediment samples collected from 62 locations across Australia were analysed for dioxins and dioxin-like chemicals. These sediment samples were distributed within different aquatic environments (i.e. fresh, estuarine and marine), various States and Territories, and different land uses (i.e. urban/industrial, agricultural and remote).

The National Dioxins Program reported concentrations of dioxins and dioxin-like chemicals as the sum of tetra- to octachlorinated PCDD/PCDF concentrations (Müller et al. 2004).

The National Dioxins Program provides a national baseline for dioxins and dioxin-like chemicals in sediments against which results from this investigation can be compared.

1.5.4 Terrestrial background values

A comparison against terrestrial background values was also undertaken for manganese and dioxins. Manganese is a naturally occurring metal in Port Curtis, which means it is not of anthropogenic origins in Port Curtis, and the source of the manganese is from geologic formations (i.e. Wandilla Formation) which occur in both upstream terrestrial and marine environments in Port Curtis. Terrestrial background values representative for Queensland and Australia are therefore considered acceptable for comparison against Project data as a regional ambient baseline level (as defined in NAGD (2009)).

There are no Australian guidelines for dioxins in soils/sediments and as such, the Dutch Intervention Levels have been used to determine potential dioxin contamination in the sediments and the risk to human health and the environment.

Terrestrial background values are also considered appropriate for this Project as dredged material will be placed in a reclamation area for this Project.

1.5.4.1 Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland

The Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (Environmental Protection Agency (EPA) 1998) were adopted for manganese as no NAGD screening level exists. While these guidelines were developed to provide best practice for managing land contamination, the Environmental Investigation Levels (EILs) have been adopted for comparison with manganese concentrations in conjunction with ambient background levels from the Port of Gladstone. The EIL for manganese was also previously adopted by the WBDDP.

1.5.4.2 Field Geologists' Manual

The Australasian Institute of Mining & Metallurgy (AusIMM) (2011), *Field Geologist's Manual,* Fifth Edition, provides the average abundance of various metals and metalloids in Australian soils. These values have been adopted as a terrestrial background value where no NAGD (2009) screening levels are provided.

1.5.4.3 Dutch Intervention Levels

The Dutch Target and Intervention Values, produced by the Dutch Ministry of Housing, Spatial Planning and the Environment (2000), provide an indication of when the functional properties of the

soil for humans, plant and animal life is seriously impaired or threatened. They are representative of the level of contamination above which there is a serious case of soil contamination.

The Dutch Target and Intervention Values provide the following concentrations for various contaminants:

- Background concentrations in soil and groundwater
- Target values for soil and groundwater to indicate the level at which there a sustainable soil quality
- Intervention levels where there is a serious case of soil or groundwater contamination

Given dredged material will be placed in a reclamation area for this Project, and an absence of locally derived reference values for dioxins, the Dutch Target and Intervention Values provide the most relevant guideline value for dioxin concentrations.

1.5.5 Adopted guidelines

Table 1.3 outlines the guideline values adopted for sediment quality during this investigation. Locally derived reference values and terrestrial background values are provided in the data summary tables for each of the investigation areas.

Table 1.3 Sediment quality guidelines

Chemical	Units	NAGD (2009) screening level[1]	NAGD (2009) high level[1]
Aluminium	mg/kg	-	-
Iron	mg/kg	-	-
Antimony	mg/kg	2	25
Arsenic	mg/kg	20	70
Cadmium	mg/kg	1.5	10
Chromium	mg/kg	80	370

Ethylbenzene	µg/kg	-	-
Xylene	µg/kg	-	-

Table notes: [1] Values provided in brackets represent revised sediment quality values as provided in Simpson et al. (2013) (unpublished).
[2] For comparison to revised sediment quality values (Simpson et al. 2013), concentrations were normalised to 1.0% total organic carbon

1.5.6 Acid sulfate soils

The Guidelines for Sampling and Analysis of Lowland Acid Sulfate Soils (ASS) in Queensland 1998 (Ahern et al. 1998) outlines action criteria at which there is a significant environmental risk from ASS when sediment is disturbed. When the action criteria are exceeded and the sediment is planned to be disturbed, management is required (e.g. treatment with lime). Table 1.4 details the action criteria, which is dependent on the clay content of the sediment and the volume of sediment disturbed.

Table 1.4 Action criteria for ASS analysis

Sediment type	Clay content (%)	Action criteria (1-1000 tonnes disturbed)		Action criteria (>1,000 tonnes disturbed)	
		Sulfur trail (%S oxidisable)	Acid trail (mol H^+/tonne)	Sulfur trail (%S oxidisable)	Acid trail (mol H^+/tonne)
Coarse (sand – gravel)	≤ 5	0.03	18	0.03	18
Medium (sandy loam – light clay)	5-40	0.06	36	0.03	18
Fine (medium to heavy clay)	≥ 40	0.1	62	0.03	18

1.6 Data quality objectives and indicators

1.6.1 Data quality objectives

Data quality objectives (DQOs) are qualitative and quantitative statements derived from the outputs of the first six steps of the seven step DQO process that:

- Clarify the study objective
- Define the most appropriate type of data to collect
- Determine the most appropriate conditions from which to collect data
- Specify tolerable limits on decision errors which will be used as the basis for establishing the quantity and quality of data needed to support the decision.

The DQO process (AS4482.1-2005) follows a systematic approach for defining the criteria that a data collection design should satisfy, including the number of samples and when, where and how to collect these samples. DQOs are employed to develop a scientific and resource-effective data collection design to assure decision makers that the type, quantity and quality of environmental data are appropriate for the intended application. In addition, decision makers will guard against committing sources to data collection efforts that do not support defensible decisions.

The DQOs for this SCP have been developed to define the type and quality of data required to achieve the objectives stated in Section 1.4. The DQOs were selected with reference to relevant guidelines published by the NAGD (2009) and the ANZECC/ARMCANZ (2000), which define minimum data requirements and quality control procedures.

These matters are addressed in the seven-step DQO approach presented in Table 1.5.

Table 1.5 Data quality objectives

Process	Response
Step 1: State the Problem	The ambient baseline condition of the sediments at East Banks Expansion DMPA; the West Banks Island DMPA, Port Central Expansion DMPA and Western Basin Expansion DMPA are required to be assessed in accordance with the requirements outlined in the NAGD (2009) and the SCP
Step 2: Identify the Decision	The principle objectives of this report are as follows: ■ Undertake sediment sampling, analysis and reporting in accordance with the approved SCP ■ Analysis of the sediments within the DMPAs for a range of physical and chemical parameters, and comparison of contaminant concentrations against the NAGD (2009) and other relevant guideline criteria ■ Characterise the ambient geochemical baseline conditions of each DMPA to assist in assessing the suitability of each DMPA to receive dredged material from the Project ■ Support the EIS for the Project.
Step 3: Identify the Inputs to the Decision	■ Footprint of DMPA sites ■ Previous investigations within the DMPA sites ■ History of offshore and reclamation dredged material placement within the Port of Gladstone ■ Field data and laboratory analysis ■ Adopted guideline criteria for sediments.
Step 4: Define the Boundaries of the Study	The boundaries of the four potential DMPA options are illustrated within Figure 1.1
Step 5: Develop a Decision Rule	The assessment programme has been designed to characterise the sediments within the DMPAs using the criteria outlined in Section 1.5.1
Step 6: Specify Tolerable Limits on Decision Errors	The data quality indicators (DQIs) have been established to set acceptance limits on field and laboratory data collected during the investigation

Process	Response
Step 7: Optimise the Design for Obtaining Data	The sampling methodology was developed with reference to the NAGD 2009 and in agreement with DoE and EHP. Nominated samples judged as being representative of sediment values were submitted for analysis. Samples were analysed by a National Association of Testing Authorities (NATA) Accredited Laboratory generally within approved sample withholding times.

1.6.2 Data quality indicators

The DQIs for the assessment are presented in Table 1.6.

Table 1.6 Data quality indicators

DQI	Field	Laboratory	Acceptability limits
Completeness	■ Sediments at the potential DMPAs require characterisation to allow assessment of suitability to receive dredged material ■ Appropriate sampling procedures to be used ■ Experienced field team to undertake sampling ■ Correct documentation to be completed	■ All required samples analysed ■ Appropriate methods ■ Appropriate limits of reporting (LORs) ■ Appropriate practical quantification limits (PQLs) ■ Sample documentation correct ■ Sample holding times in compliance	As per NAGD 2009 and Simpson et al. (2013) (unpublished)
Comparability	■ Correct sample procedures used at each location ■ Experienced field team ■ Same type (medium, volume and sampling technique) of samples collected	■ Same analytical methods used ■ Appropriate LORs ■ Samples submitted to the same NATA accredited laboratory ■ Analytical data is presented in the same unit	As per NAGD 2009
Representativeness	■ Appropriate media sampled ■ All media identified (i.e. sediment)	■ All required samples analysed	As per NAGD 2009
Precision	■ Correct sample procedures used at each location ■ Collection of appropriate quality assurance (QA)/ quality control (QC) samples	Analysis of: ■ Duplicate samples ■ Laboratory duplicate samples	Relative percent deviation (RPD) of 30-50%

DQI	Field	Laboratory	Acceptability limits
Accuracy	■ Sampling procedures appropriate and complied with ■ Collection of appropriate QA/QC samples	Analysis of: ■ Method blanks ■ Laboratory surrogate spikes ■ Laboratory control samples ■ Reference material	■ Non-detect for contaminants of concern ■ 70-130%

2 Methodology

2.1 Sediment Characterisation Plan

The DMPA SCP was approved by DoE and EHP in January 2015. All sampling and analysis of sediments were undertaken in accordance with the approved DMPA SCP and NAGD requirements. The approved DMPA SCP is provided in Appendix A.

2.2 Fieldwork programme

The initial geochemical sediment investigation was undertaken between 2 February and 28 February 2015 with additional sampling during the Project geotechnical investigation in April 2015. A summary of the programme of works is provided in Table 2.1.

Table 2.1 Programme of works

Activity	Date
Mobilisation	2 February 2015
Inductions	2 February 2015 (and ongoing as required)
Drilling operations	3-27 February 2015 (including six standby days due to inclement weather)
Demobilisation	28 February 2015

Two environmental scientists from Aurecon provided supervision on behalf of GPC in addition to sample collection and processing. Seas Offshore was contracted to provide and manage the drilling component of the works and Fodico was subcontracted to provide and operate the vessel "Shackleton".

The field team was directly supported by ALS Environmental (primary laboratory), Eurofins (secondary laboratory) and onshore Aurecon staff specialising in marine investigations, data management, global information systems (GIS) and project management.

Additional sampling was undertaken within West Banks Island and Port Central Expansion DMPAs by the Aurecon geotechnical team during Project geotechnical investigations. Geotechnical sampling was undertaken to depths of 4.0m (generally at 1.0m intervals) to provide information on the known naturally occurring metals.

2.3 Sample locations

The sampling locations provided in the DMPA SCP were randomly selected using the methodology outlined in NAGD (2009). The actual sampling locations (with an accuracy of ±10m) are illustrated in Figures 2.1 to 2.4.

Figure 2.4: Sampling Locations – Western Basin Expansion DMPA

In accordance with the DMPA SCP, the following boreholes were assessed during the investigation:

- East Banks Expansion DMPA:
  - 36 boreholes
- West Banks Island DMPA:
  - 27 boreholes
  - 2 boreholes (geotechnical)
- Port Central Expansion DMPA:
  - 11 boreholes
  - 2 boreholes (geotechnical)
- Western Basin Expansion DMPA:
  - 21 boreholes.

All boreholes were drilled to a depth of 1.0m or until refusal.

2.4 Sample collection

A vibrocorer, operated by Seas Offshore aboard the vessel “Shackleton”, was used to collect the sediment cores at each location. A hand-held GPS device was used to position the vessel within 10m of each sample location, as proposed Section 6.2.2 of the SCP (refer Appendix A).

The vibrocorer sampled to a depth of 1.0m or until refusal. Core barrels were capped at each end following core retrieval and a vibrocore frame was used to ensure the barrel remained vertical. Photographs of the equipment used and the vessel are provided below.

Multiple cores were collected where additional volume of sediment was required for QA/QC purposes.

An Aurecon environmental scientist determined the suitably of each sediment core following collection, based on the following:

- No loss of surface sediments
- No major loss or disturbance of sediments at depth
- Target depth was achieved or refusal at rock or dense sand or clay.

Sediment samples were also collected at two additional locations within West Banks Island DMPA and two additional locations within Port Central Expansion DMPA, in conjunction with geotechnical investigation drilling using the Ocean Driller II jack-up barge. These samples were generally collected from 1.0m intervals (where practicable) to a depth of 4.0m and were used to supplement the geochemical investigation and provide an indication of the naturally occurring metals.

SPOCAS	30	5
Western Basin Expansion DMPA (WBE)[1]		
Geochemical	41	2 (field triplicate) 1 (inter-laboratory duplicate)
Particle size distribution	41	-
Dioxin	-	-
Field pH	41	-
SPOCAS	62	9

Table note: [1]Samples were labelled as BE during field investigations to avoid confusion with West Banks Island

2.5 Sample processing

Sediment cores were cut into 1.0m lengths, split horizontally, photographed and logged prior to sampling. Each borehole log recorded the following information:

- Project name and number
- Name of sampler
- Date of sampling
- Type of sampler
- Sample location ID
- Easting and Northing of sample location
- Sediment colour, odour, texture (clay, silt, sand, gravel), plasticity and grain size
- Presence of organic matter, marine organisms, shells and anthropogenic material.

The sediment cores were split upon recovery and sub sampled along one split only (where sample quantity was sufficient). Following logging of each sediment core, grabs samples were collected from each 0.5m section of the core in 150mL glass jars for volatile analysis. Grab samples of approximately 200g were also collected at 0.25m intervals along the length of the core and placed in plastic bags for ASS analysis.

Grab samples were also collected from core at depth intervals of 0.0m to 0.5m and 0.5m to 1.0m for particle size distribution and the remaining geochemical analyses.

2.6 Laboratory analysis

The primary analysis of sediment samples was conducted by ALS Environmental. Eurofins was selected as the secondary laboratory to analyse inter-laboratory duplicate samples. Both laboratories are NATA accredited for the analytical methods used.

Samples submitted to the primary laboratory were analysed for the contaminants listed in Table 2.3. Analyses conducted by the secondary laboratory are outlined in Table 2.4.

Table 2.3 **Analyses conducted by the primary laboratory**

Parameter	PQL	Sample suffix
Metals (Al, Sb, As, Cd, Cr, Cu, Co, Fe, Pb, Mn, Ni, Se, Ag, V and Zn)	0.1-1mg/kg 0.01mg/kg (Hg) 10mg/kg (Mn)	A
Organotins	0.5-1µg/kg	A
TRH	3-5mg/kg	A, V
BTEX	200µg/kg	V
PAHs	4-5µg/kg	A
PCB	5µg/kg	A
OCP/OPP	0.5-10µg/kg	A
TOC	0.02%	A
Nitrogen (speciated)	0.1mg/kg (nitrites and nitrates) 0.2mg/kg (ammonia) 20mg/kg (total nitrogen)	A
Phosphorus	2mg/kg	A
Particle sizing	1.0%	B
Dioxins and furans	0.0005-0.01µg/kg	D
pH_F and pH_{FOX}	0.1 pH units	C
SPOCAS suite	Various	C

Table 2.4 **Analyses conducted by the secondary laboratory**

Parameter	PQL
Metals (Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag and Zn)	0.1-1mg/kg 0.01mg/kg (Hg) 10mg/kg (Mn)
Organotins	0.5µg/kg
TRH	20-100mg/kg
BTEX	100-300µg/kg
PAHs	1µg/kg
PCB	5µg/kg
OCP/OPP	1-5µg/kg
TOC	50mg/kg
Nitrogen (speciated)	0.1mg/kg
Phosphorus	5mg/kg

2.7 Quality assurance and quality control procedures

2.7.1 Laboratory procedures

The primary and secondary laboratories followed the laboratory QA/QC procedures outlined in Appendix F of NAGD, including analysis of laboratory blanks, laboratory controls, laboratory spiked samples and laboratory duplicates.

Validation of the laboratory QA/QC procedures is provided in Section 7.1 to determine the data quality to undertake an assessment of the geochemical characteristics of the potential dredged material.

Table 2.5 outlines the laboratory QA/QC procedures as required under NAGD (2009).

Table 2.5 Laboratory QA/QC procedure details

QA/QC procedure	Details
Laboratory blank	Laboratory blanks are submitted with each sample batch during analysis to determine the level (if any) of cross contamination that may occur during laboratory preparation, extraction and/or analysis. Analysis of the laboratory blanks should result in contaminant concentrations that do not exceed the LOR
Laboratory control	Laboratory controls are submitted with each sample batch and contain known concentrations of a contaminant. Analysis of the laboratory controls should result in contaminant concentrations that do not deviate from the known concentration to determine the accuracy of the laboratory analysis
Laboratory spike (surrogate and matrix)	A surrogate laboratory spike involves additions of a known concentration of compounds that are similar to those analysed, but are not likely to be present in the environment. The recovery of these compounds indicates the ability of the laboratory to extract the specified analyte. Surrogate spikes are generally performed on organic compounds A matrix laboratory spike is performed by splitting a sample and spiking it with a known contaminant concentration. The recovery of the contaminant is calculated and used to determine interference from the sediment upon the level of recovery
Laboratory duplicates	Laboratory duplicates use RPD of an intra-laboratory split sample material to analyse laboratory precision

2.7.2 Field procedures

2.7.2.1 Sample processing

All staff collecting sediment samples wore disposable nitrile, powder free gloves, which were replaced for each sample to ensure no cross-contamination between sampling locations and sample depths occurred.

All sediment samples were collected in pre-labelled plastic bags or solvent-washed and acid rinsed glass jars to Teflon lined lids as appropriate. Sample containers were labelled with a unique sample number on the waterproof label with indelible ink.

Sample containers for volatile analytes were filled with zero headspace to prevent volatilisation. Field triplicates and inter-laboratory duplicates were given labels that did not relate to the sampling location. Once collected and labelled, samples were immediately stored in an esky with ice bricks and transported to the laboratory within the specified holding times (generally within 24 hours).

All samples were submitted under chain of custody documentation to ensure the analytical requirements of each sample were undertaken.

2.7.2.2 Decontamination procedure

At the beginning of each sampling day, the vessel was thoroughly inspected and washed down to prevent sample contamination. An area for sample processing was cleared of any potential sources of contamination (i.e. copper, brass or galvanised or oily surfaces).

Stainless steel equipment was used for sample collection and was cleaned before use and in between samples. Prior to obtaining each sample, all equipment, including core barrels, core trays and sampling equipment was cleaned as follows:

- Initial rinse with seawater
- Scrub with detergent solution (Decon 90)

- Rinse with seawater
- Final rinse with distilled water.

2.7.2.3 Additional field QA/QC

A trip blank container filled with clean chromatographic sand (as provided by the laboratory) was transported with the samples each day and analysed for volatile contaminants. Trip blanks were used to identify contaminants that may have contaminated the sediment samples during transport or storage.

A rinsate sample was collected once per day from a trowel used during sampling, as this was where the risk of cross-contamination between samples was most likely. Rinsate sample were analysed for the same contaminants as the sediment (i.e. those provided in Table 2.3). Rinsate results should be below the LOR to validate the decontamination procedure.

Field triplicates were collected at approximately 10% of sampling locations to determine the small-scale spatial variability of the chemical characteristics of the sediment. This was undertaken by collecting two cores in addition to the primary core from the field triplicate location and collecting a sample from each core at the same depths.

Inter-laboratory duplicates were collected at approximately 5% of sampling locations to identify variation associated with sub-sampled handling and analytical variation between laboratories. Inter-laboratory duplicates were collected from the same homogenised sediment as the primary sample, with one inter-laboratory duplicate analysed by the primary laboratory and the other inter-laboratory duplicate analysed by the secondary laboratory.

With the ASS sampling, approximately 13.5% of samples undergoing SPOCAS analysis were submitted with a blind duplicate sample to assess the variability and precision of both the sampling procedure and the analytical laboratory.

2.8 Data analysis

Contaminant concentrations were assessed against the guideline values outlined in Table 1.3 using the 95% upper confidence level of the mean (95% UCL), calculated with ProUCL Version 5.0 (U.S. EPA 2013). Where no analytical values of a contaminant were reported over the NAGD PQL, no analysis was undertaken. Statistics were not calculated where all values fell below PQL. In some cases where less than three values were above LOR for the respective contaminant, the maximum recorded value was used instead of the 95% UCL for a conservative comparison against NAGD screening levels. Where contaminant concentrations were below the LOR, a value of half the LOR was used, as per NAGD (2009).

Concentrations of organic contaminants (except organotin) were adjusted to 1.0% total organic carbon (TOC). Organic contaminant results were normalised to 1.0% TOC before being compared to relevant guideline values where the measured value was within the range of 0.2-10%. For TOC values outside of this range, the highest (10%) or lowest (0.2%) was adopted as appropriate. Organic contaminants with concentrations below detection limits were not normalised to 1.0% TOC but were included at half their LOR.

Calculation of the 95% UCL assumes that the samples are statistically independent. As such, field triplicates and inter-laboratory duplicates were not included in the 95% UCL calculation. Where retesting of samples was undertaken, the highest reported value was utilised in the calculations.

2.9 Compliance with SCP

Compliance of the Project geochemical investigation with the approved SCP and NAGD (2009) is demonstrated by:

- Drilling and sampling has been undertaken to full depth of sediment that has the potential to be contaminated and is considered to have potential to interact with the dredged material. The vibrocorer achieved refusal in consolidated natural geological materials (i.e. rock, dense sands/gravels or stiff to very stiff clays)
- Sampling used a vibrocoring process, a NAGD recognised approved device for undertaking geochemical sampling.

Additional sediment sampling and laboratory analysis for metals and metalloids was undertaken in the underlying consolidated natural geological materials, in conjunction with the Project geotechnical investigation in four additional locations (two locations in West Banks Island DMPA and two locations in Port Central Expansion DMPA) to collect information on metals and metalloids that have previously been demonstrated to be naturally occurring within Port Curtis.

Drilling was required to a depth of 1.0m or until refusal. Drilling reached a depth of 1.0m in 69 locations. Drilling was terminated in 26 boreholes due to refusal on stiff clay or gravels. The majority of these refusals (80.8%) occurred in East Banks Expansion DMPA due to the presence of a layer of stiff clay. The number of boreholes achieving a depth of 1.0m or refusal is outlined in Table 2.6.

Table 2.6 Number of boreholes achieving refusal at each DMPA

DMPA	Total number of boreholes	Number of boreholes that achieved 1.0m	Number of boreholes that encountered refusal
East Banks Expansion DMPA	36	15	21
West Banks Island DMPA	27	25	2
Port Central Expansion DMPA	11	9	2
Western Basin Expansion DMPA	21	20	1

As a result of these refusals using the vibrocore technique, two additional boreholes were drilled within both West Banks Island and Port Central Expansion DMPAs (to depths of 4.0m bgl) during the geotechnical investigations to provide further geochemical information of the sediments at depth.

Table 2.7 outlines the sampling locations that were refused prior to reaching the target depth of 1.0m.

Table 2.7 Sampling locations refused

Sampling location	Depth of refusal (m)	Sampling location	Depth of refusal (m)

3 East Banks Expansion DMPA

3.1 General

Borehole logs for each of the sampling locations are presented in Appendix B and photographs of each of the cores collected are provided in Appendix C.

All laboratory results and laboratory QA/QC assessments are provided in Appendix D for the primary laboratory (ALS Environmental) and Appendix E for the secondary laboratory (Eurofins).

3.2 Geochemical

A statistical summary of the geochemical results, showing an assessment against relevant guideline values identified in Section 1.5.1, is provided in Table 3.1 and Appendix F. Analyte concentrations detected above the guideline values are highlighted in bold, along with the relevant assessment criteria. Where guideline values are not available, a comparison against locally derived reference values and terrestrial background values has been undertaken.

The distribution of the contaminants of concern (and observed exceedances) was ubiquitous throughout the sediment profile sampled and the spread was across the DMPA indicating that the metals are widespread and naturally occurring.

The analytical results and any exceedances are discussed in the following sections.

Sampling locations where guideline values have been exceeded are illustrated in Figures 3.1 to 3.4.

Table 3.1 Summary of geochemical results for the East Banks Expansion DMPA compared with guideline values

Analytes (mg/kg)		Aluminium	Iron	Arsenic	Cadmium	Chromium	Copper	Cobalt	Lead	Manganese	Nickel	Selenium	Silver	Vanadium	Zinc	Mercury	Ammonia as N

Number of exceedances[1, 3]		27	31	3	-	-	1	41	-	9	4	7	-	34	-	-	-

Table notes:
[1]Refers to exceedances over NAGD (2009) screening levels, the QLD contaminated land guideline value (EPA 1998) or the PCIMP (2011) EH values
[2]Three detections only over NAGD PQL so the highest value of 0.3mg/kg has been utilised rather than calculating 95% UCL
[3]The distribution of the contaminants of concern (and observed exceedances) was ubiquitous throughout the sediment profile sampled and the spread was across the DMPA indicating that the metals are widespread and naturally occurring
Values in brackets are the median value
Bold indicates an exceedance of the corresponding guideline value

Figure 3.4: Distribution of elevated manganese within East Banks Expansion DMPA

3.2.1 Metals/metalloids

Aluminium, iron, arsenic, chromium, copper, cobalt, lead, manganese, nickel, selenium, vanadium and zinc were recorded above laboratory PQL in all 56 samples collected. The elements were found at every depth horizon and as such, are ubiquitous across Port Curtis and likely to be naturally occurring. Three samples reported levels of cadmium over the LOR, five samples reported silver above the LOR and 27 samples of the 56 samples tested reported mercury over the laboratory LOR. No antimony over the laboratory LOR was detected.

The 95% UCL of all metals and metalloids considered contaminants of concern under the NAGD (2009) were below the NAGD screening levels. However, the 95% UCL for manganese was 743.2mg/kg, which is above the QLD Contaminated Land Guidelines EIL for manganese of 500mg/kg (EPA 1998).

A small number of arsenic, copper and nickel sample values demonstrated values slightly above the NAGD screening levels; however, none of these exceedances were recorded at levels greater than their respective NAGD high levels. Manganese, however, was recorded within nine samples at concentrations above the guideline value of 500mg/kg, which is discussed further below.

Metals with no NAGD screening level values (i.e. aluminium, iron, cobalt, manganese, selenium and vanadium) were compared against the locally derived reference values and terrestrial background values. While there were exceedances over the PCIMP EH values, comparison to other background investigations in Port Curtis, such as Angel et al. (2012), GHD (2009) and Anastasi and Wilson (2010), indicated that a number of metals were naturally elevated within Port Curtis.

No discussion has been presented for antimony as no concentrations were reported above the NAGD (2009) PQL.

3.2.1.1 Aluminium

Guideline values

No NAGD screening level values are available for aluminium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Aluminium was reported over the laboratory LOR within each of the 56 samples collected, with a minimum concentration of 3,080mg/kg at EB34 (0.5m to 1.0m) and a maximum concentration of 29,200mg/kg within EB2 at a depth of 0.5m to 0.85m.

When the results for aluminium are compared with the PCIMP EH value, 27 of the 56 samples recorded concentrations above the PCIMP EH value and the 95% UCL was 15,731mg/kg, slightly above the PCIMP EH value of 15,000mg/kg but substantially below the PCIMP WCS value of 150,000mg/kg.

Previous sediment investigations in Port Curtis recorded median aluminium concentrations of 8,770mg/kg (Angel et al. 2012) and 8,190mg/kg (GHD 2009). The median aluminium concentration recorded at East Banks Expansion DMPA (13,150mg/kg) is greater than these background values.

However, the 95% UCL for this investigation was within the background ranges for aluminium from both Angel et al. 2012 and GHD 2009 investigations, although the maximum concentration recorded for this investigation (29,200mg/kg) was above these background ranges.

Elevated concentrations of aluminium appear to be widespread across East Banks Expansion DMPA and throughout the depth profile of the sediments, indicating that aluminium is naturally occurring in Port Curtis.

3.2.1.2 Iron

Guideline values

No NAGD screening level values are available for iron and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Iron was reported over the laboratory LOR within each of the 56 samples collected with a minimum concentration of 8,040mg/kg within EB34 at a depth of 0.5m to 1.0m and a maximum concentration of 43,900mg/kg within EB2 at a depth of 0.5m to 0.85m.

When the results for iron are compared with the PCIMP EH value, 31 of the 56 samples reported above the PCIMP EH value and the 95% UCL was 26,414mg/kg, above the PCIMP EH value of 21,000mg/kg but substantially below the PCIMP WCS value of 210,000mg/kg.

Previous sediment investigations in Port Curtis recorded median iron concentrations of 17,450mg/kg (Angel et al. 2012) and 20,900mg/kg (GHD 2009). The median iron concentration recorded at East Banks Expansion DMPA (24,600mg/kg) is greater than these background values.

Iron concentrations in all samples at East Banks Expansion DMPA were within the background range for iron in Port Curtis derived by Angel et al. (2012) (4,970-62,600mg/kg) and recorded during the WBDDP (560-76,000mg/kg) (GHD 2009).

The distribution of iron in Port Curtis appears similar to that of aluminium, with elevated concentrations of iron widespread across East Banks Expansion DMPA and throughout the depth profile of the sediments.

3.2.1.3 Arsenic

Guideline values

Arsenic was recorded above the PQL within each of the 56 samples collected, with three of the samples reporting concentrations above the NAGD screening level of 20mg/kg. The minimum concentration reported was 2.4mg/kg within EB32 at a depth of 0.5m to 1.0m and the highest concentration was 33mg/kg from EB21 at a depth of 0.0m to 0.5m. No concentrations were recorded over the NAGD high level and the 95% UCL reported a value of 11.48mg/kg, which is well below the NAGD screening level value.

Arsenic has previously been demonstrated to occur naturally within Port Curtis at concentrations very close to ANZECC ISQG-low guidelines. Vicente-Beckett et al. (2006) showed via multivariate analyses that the concentrations of arsenic (as well as nickel and chromium) in the Port Curtis region are at natural background levels which are very close to the ANZECC ISQG-low guidelines.

The widespread occurrence of arsenic in local sediments is consistent with the local geological formations surrounding Port Curtis. Arsenic is common in marine mudstones (Doonside and Wandilla Formations) where it substitutes for sulfur in the mineral pyrite, and in mineralised sequences surrounding granite intrusions (Mount Larcom area). The arsenic is often locked into framboidal pyrite structures where it remains immobilised until exposed to weathering. Examination of the arsenic exceedances in a stratigraphic context has found that a strong association exists between the metalloid and distribution leading to accretion of transported sediments from weathered localised sources. These sources appear to be either sub-marine basement material underlying substrate highs, or a landward origin, such as an early reworking of adjacent surface soils.

Locally derived reference values

Given the 95% UCL for arsenic was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

3.2.1.4 Cadmium

Guideline values

Only three samples demonstrated levels of cadmium over the NAGD PQL with the maximum concentration only 0.3mg/kg, recorded from EB6 at a depth of 0.5m to 1.0m. As such, the maximum of 0.3mg/kg is utilised rather than calculating a 95% UCL. This concentration is well below the NAGD (2009) screening level of 1.5mg/kg and NAGD high value of 10mg/kg.

Locally derived reference values

Given cadmium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

3.2.1.5 Chromium

Guideline values

Chromium was recorded above the NAGD PQL in all 56 samples with a minimum concentration of 7.8mg/kg from EB34 at a depth of 0.5m to 1.0m and maximum concentration of 34mg/kg from EB2 at a depth of 0.5m to 0.85m. No samples reported concentrations above the NAGD screening level of 80mg/kg and the 95% UCL for all depth samples of 21.36mg/kg was significantly lower than the NAGD screening level.

Locally derived reference values

Given chromium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

3.2.1.6 Copper

Guideline values

Copper was recorded above the NAGD PQL in all 56 samples with one sample at EB22 (0.0m to 0.5m) exceeding the NAGD screening level of 65mg/kg (reporting a value of 79.5mg/kg). The 95% UCL of 31.5mg/kg is however significantly below the NAGD screening level.

Locally derived reference values

Given the 95% UCL for copper was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

3.2.1.7 Cobalt

Guideline values

No NAGD screening level values are available for cobalt and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Cobalt was recorded over laboratory LORs in all 56 samples, with 41 of the 56 samples reporting over the PCIMP EH value of 6.9mg/kg. The minimum concentration was 4mg/kg within EB8 at a depth of 0.0m to 0.5m and the maximum concentration was 47.4mg/kg from EB14 at a depth of 0.5m to 1.0m.

The 95% UCL was 12.21mg/kg which is nearly twice that of the PCIMP EH value but well below the PCIMP WCS value of 69mg/kg.

The 95% UCL for cobalt (12.21mg/kg) was within the background range in Port Curtis, as recorded by Angel et al. (2012) and during the WBDDP (GHD 2009). In addition, the median concentration for cobalt at East Banks Expansion DMPA (9.9mg/kg) is equal to the medians from both Angel et al. (2012) and GHD (2009).

Terrestrial background values

The cobalt concentrations in all samples are within the terrestrial background values, which range from 2 to 170mg/kg (EPA 1998) and the median concentration is similar to the average abundance of cobalt in soil, as determined by AusIMM (2011).

3.2.1.8 Lead

Guideline values

Lead was recorded in all 56 samples above the NAGD PQL. No samples were recorded above the NAGD screening level of 50mg/kg and the maximum concentration recorded was 14.9mg/kg, sampled from EB14 (0.5m to 1.0m), which is well below the NAGD screening level (as was the 95% UCL of 9.55mg/kg).

Locally derived reference values

Given lead was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

3.2.1.9 Manganese

Guideline values

No NAGD screening level values are available for manganese and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Manganese was reported above the NAGD PQL in all 56 samples at East Banks Expansion DMPA with a minimum concentration of 94mg/kg from EB8 at a depth of 0.5m to 1.0m and a maximum concentration of 3,510mg/kg from EB1 at a depth of 0.5m to 1.0m.

Angel et al. (2010) investigated dissolved metal levels in Port Curtis, including manganese and concluded that nickel and manganese are likely to be released by natural processes such as reduction of manganese (hydr)oxides and leaching by the lower sediment and water pH. Anastasi and Wilson (2010) also examined Port Curtis as a case study in reviewing manganese in subtropical estuaries and stated that recorded naturally occurring manganese concentrations have been recorded in marine sediments with values up to 9,000mg/kg.

Previous sediment investigations in Port Curtis recorded median manganese concentrations of 382.5mg/kg (Angel et al. 2012) and 298mg/kg (GHD 2009a). In addition, concentrations of manganese in the sediments of Port Curtis derived by Angel et al. (2012) and during the WBDDP (GHD 2009) were recorded up to 1,330mg/kg and 7,680mg/kg, respectively.

The median manganese concentration recorded at East Banks Expansion DMPA was 280.5mg/kg, which is below the corresponding median concentrations determined during the previous investigation by Angel et al. (2012) and during the WBDDP (GHD 2009).

The 95% UCL for manganese at East Banks Expansion DMPA was 743.2mg/kg, which is consistent with background concentrations identified in previous investigations within Port Curtis.

Manganese is the twelfth most abundant element in the Earth's crust with among 300 minerals containing manganese and the two main manganese minerals being pyrolusite (MnO_2) and rhodochrosite ($MnCO_3$). It is an essential element and is required by mammals and birds for normal growth. High concentrations of manganese may occur under anoxic (absence of oxygen) conditions such as the bottom of deep reservoirs or lakes, or in groundwater.

There are six separate areas of manganese mineralisation located within the Gladstone area with the most significant of which being the historic Mount Millar manganese mine which opened in 1895 and operated intermittently until 1916 and then from 1958 to 1960. Exploration permits are currently active within the Gladstone area (Genesis Resources Ltd 2010) examining the viability of several northwest striking manganese ore deposits within the Doonside Formation approximately 15km west of Gladstone. The deposits occur as structurally controlled lenses parallel to bedding in the enclosing sediments.

Manganese was historically mined from 1882 to 1900 at Auckland Hill, adjacent to Port Curtis (GPC 2012). The rocky face of Auckland Hill is a remnant of this manganese mining and quarrying.

Terrestrial background values

Manganese is not specified within the NAGD (2009) guidelines but is included within the EPA Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (1998). As such, the manganese EIL of 500mg/kg has been utilised in order to report the levels contained within seabed sediments. Manganese was reported at concentrations over the 500mg/kg EIL within nine samples at East Banks Expansion DMPA. The 95% UCL value of 743.2mg/kg was above the QLD Contaminated Land Guideline EIL of 500mg/kg (EPA 1998).

Background levels provided by the EPA Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (1998) ranged from 4 to 12,600mg/kg, indicating a large abundance of manganese in Queensland soils.

The AusIMM (2011), *Field Geologist's Manual,* Fifth Edition, provides background ranges for various metals and metalloids in Australia, with an average abundance of 850mg/kg for manganese observed in Australian soils. The 95% UCL for manganese (743.2mg/kg) was below this background value and within the range provided by the EPA (1998).

While the sediments did report a 95% UCL higher than the 500mg/kg EIL, these are likely to be naturally occurring and in line with levels previously reported within the Port Curtis area in previous studies.

3.2.1.10 Nickel

Guideline values

Nickel was recorded over the NAGD PQL for all 56 samples collected with four samples reporting concentrations at or above the NAGD screening level of 21mg/kg with a maximum concentration of 25.8mg/kg from EB2 at a depth of 0.5m to 0.85m. The 95% UCL for nickel was 13.4mg/kg, which is well below the NAGD screening level.

Locally derived reference values

Given the 95% UCL for nickel was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

3.2.1.11 Selenium

Guideline values

No NAGD screening level values are available for selenium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Selenium reported detection above the laboratory LOR for all 56 samples, with seven of these samples reporting concentrations over the PCIMP EH value of 1.0mg/kg (with a maximum concentration of 2.7mg/kg from EB34 from a depth of 0.0m to 0.5m). The 95% UCL was only slightly above the PCIMP EH value at 1.07mg/kg and significantly below the PCIMP WCS value of 10mg/kg.

In addition, sediment investigations during the WBDDP recorded concentrations of selenium ranging from 0.1-5.4mg/kg with a median concentration of 0.4mg/kg (GHD 2009). These results are similar to concentrations from East Banks Expansion DMPA, which recorded a median concentration of 0.6mg/kg.

3.2.1.12 Silver

Guideline values

Silver was detected above the NAGD PQL within five of the 56 samples. No samples were however recorded above the NAGD screening level of 1mg/kg and the maximum concentration was 0.3mg/kg from EB22 at a depth of 0.0m to 0.5m.

Locally derived reference values
Given silver was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

3.2.1.13 Vanadium

Guideline values
No NAGD screening level values are available for vanadium and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values
Vanadium was detected above the laboratory LOR in all 56 samples, with 34 of the samples reporting values above the PCIMP EH value of 40mg/kg (with a maximum concentration of 113mg/kg from EB2 at a depth of 0.5m to 0.85m). The 95% UCL was calculated at 58.32mg/kg which is above the PCIMP EH value but well below the PCIMP WCS value of 400mg/kg.

Angel et al. (2012) identified vanadium concentrations in sediments of Port Curtis ranging from 11 to 114mg/kg while vanadium concentrations in sediments ranged from 5.6 to 287mg/kg during the WBDDP (GHD 2009). The vanadium concentrations identified at East Banks Expansion DMPA had a very similar range with a median concentration of 52.9mg/kg and a 95% UCL of 58.32mg/kg, both within the background range, indicating that vanadium is naturally occurring in Port Curtis.

Terrestrial background values
In addition, AusIMM (2011) provides an average abundance value of 100mg/kg for vanadium as observed in Australian soils. The 95% UCL for vanadium (58.32mg/kg) at East Banks Expansion DMPA is well below this value.

3.2.1.14 Zinc

Guideline values
Zinc was recorded above the NAGD PQL in all of the 56 samples collected and no exceedances were recorded over the NAGD screening level of 200mg/kg with a maximum concentration of 76.3mg/kg from EB14 at a depth 0.5m to 1.0m.

Locally derived reference values
Given zinc was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

3.2.1.15 Mercury

Guideline values
Mercury was recorded in 27 of the 56 samples at levels over the NAGD PQL. No exceedances however were recorded over the NAGD screening level of 0.15mg/kg with a maximum concentration of 0.03mg/kg from EB14 at a depth of 0.5m to 1.0m.

Locally derived reference values
Given mercury was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

3.2.2 Organics and BTEX

No polychlorinated biphenyl (PCB), organochlorine pesticide (OCP) and organophosphate pesticide (OPP) concentrations were detected with all samples tested reporting below the laboratory LORs (and hence below guideline levels) for these contaminants.

One of the 56 samples analysed reported the sum of (11) polycyclic aromatic hydrocarbons (PAHs) above the laboratory LOR. This sample reported a concentration of 14µg/kg made up of phenanthrene, fluoranthene and pyrene, and was sampled from EB32 at a depth of 0.7m. This concentration is considerably below the NAGD screening level of 10,000µg/kg.

No total recoverable hydrocarbon (TRH) C_6-C_{10} fraction concentrations were detected although approximately half the samples recorded concentrations of the >C_{10}-C_{40} fraction above the NAGD PQL (29 values of 56 samples analysed). When adjusted to 1.0% TOC, maximum concentration was 140mg/kg from EB2 at a depth of 0.5m to 0.85m with a 95% UCL of 37.89mg/kg which is well below the NAGD screening level of 550mg/kg and the proposed Simpson et al. (2013) revised screening level of 280mg/kg.

A small number of samples (10 samples from 56 samples) recorded total petroleum hydrocarbon (TPH) concentrations over the LOR with the maximum concentration recorded being 160mg/kg (adjusted to 1.0% TOC) from EB2 (0.5m to 0.85m) with the 95% UCL being 29.51mg/kg (adjusted to 1.0% TOC). Benzene, toluene, ethylbenzene and xylene (BTEX) was not detected above the laboratory LOR in any of the samples collected.

3.2.3 Organotins

No samples reported a concentration of tributyltin above the NAGD PQL of 1.0µg Sn/kg.

3.2.4 Nutrients and total organic carbon

No trigger limits exist for TOC and nutrients in sediments within the NAGD (2009) guidelines although the PCIMP has set EH values derived from the 95th percentile of background data collected during the PCIMP monitoring with WCS values being set at 10 times the PCIMP EH values. The PCIMP EH and WCS values set for ammonia as N are 15mg/kg and 150mg/kg respectively.

Simpson et al. (2013) (unpublished) provides revised sediment quality values, with a proposed screening level of 4.0mg/kg for ammonia.

All 56 samples analysed for ammonia as N were recorded above the NAGD PQL of 0.1mg/kg, however there were no exceedances of the PCIMP EH 15mg/kg recorded. The Simpson et al. (2013) screening levels were exceeded in two samples with a maximum concentration of 4.8mg/kg from EB28 at a depth of 0.0m to 0.4m. However, the 95% UCL for ammonia was 1.583mg/kg, which is below the Simpson et al. (2013) screening level.

Sediment total ammonia as N concentrations have been found to be generally higher at locations within Port Curtis with higher TOC and silt/clay content, compared to sites characterised by coarser material. The 95% UCLs for TOC and ammonia as N were 0.15% and 1.58mg/kg, respectively. It was very difficult to characterise a general sediment type at this site as the samples varied with half the samples comprising of fine sediments and the other half comprising of sand, cobble and gravel mix sediments.

3.2.5 Dioxins

Guideline values

NAGD (2009) does not provide screening levels for dioxins.

Minimal sampling for dioxins levels has been undertaken previously within Port Curtis, with virtually no samples undertaken within the shipping channels. As such, 22 samples were taken throughout Port Curtis as part of the sediment characterisation for the Project, with five samples collected from East Banks Expansion DMPA (refer Figure 3.5). Results are discussed for all of the samples undertaken, as there was no significant difference between results when analysed for the five samples as opposed to the full 22 samples. As a result, the full 22 dioxin samples were utilised to strengthen the analysis.

The summary dioxin results are:

- Median: 0.355pg TEQ/g
- Maximum: 2.89pg TEQ/g
- Minimum: 0.04pg TEQ/g.

Canadian sediment quality guidelines provide for dioxins in marine environments by adopting the freshwater ISQGs and probably effect levels (PELs). This is due to a paucity of data for the marine environment (Canadian Council of Ministers of the Environment (CCME) 1999). As a result, any comparison against these levels should be considered indicative only.

The Canadian ISQGs represent the concentration below which adverse biological effects are expected to rarely occur while PELs are the concentration above which adverse effects are expected to frequently occur. The Canadian ISQG value for dioxins is 0.85pg TEQ/g while the PEL is 21.5pg TEQ/g (CCME 1999).

All dioxin concentrations recorded during the investigation are significantly below the PEL, while the median concentration is below the ISQG, indicating that dioxins within the sediments of Port Curtis are unlikely to result in adverse biological effects.

Locally derived reference values

The National Dioxins Program (Müller et al. 2004) has investigated the levels of dioxins around Australia by reporting the concentrations of dioxins and dioxin-like chemicals. Dioxins often occur as complex mixtures and exert their toxicity by the same mechanism, the concept of toxic equivalents. This concept allows the concentration or mass of each dioxin in a complex mix to be connected to an equivalent mass of the most toxic dioxin – 2,3,7,8 tetrachlorodibenzo-p-dioxin (TCDD) by using a set of toxic equivalency factors (TEFs) which rate the toxicity of the various dioxins against TCDD. The equivalent TCDD concentrations are then summed (∑) to estimate the concentration of mixture of dioxins as a TCDD equivalent concentration (called ∑TEQ).

EHP undertook dioxin sampling across 31 sites within Port Curtis and related waterways in early 2012 whilst investigating the sediment quality of Port Curtis and its tributaries. Many dioxins were detected and these detection values were compared with dioxin concentrations from the National Dioxins Program using toxic equivalence values (∑TEQ). The ∑TEQ values were found to be typical of those recorded throughout Australia for aquatic sediments adjacent to urban/industrial environments and the values were considered typical of estuaries in Australia.

In order to place this investigation in context and compare with the Müller et al. (2004) study and the EHP (2012) Port Curtis results, the World Health Organization (WHO) TEF calculated using zero for not detected dioxins was utilised. As noted within EHP (2012) Port Curtis report, an exact comparison cannot be made as the WHO has made some minor changes since the National Dioxins Program. A comparison of dioxins ∑TEQ values using the same TEFs cannot be made as the raw data from the National Dioxins Program are not available.

The Port Curtis study (EHP 2012) adapted two Müller et al. (2004) box plot figures and compared these against their own results. Müller et al. (2004) provides an explanation for interpretation of the box plots. When dioxin results from the Project geochemical investigation are compared with both of these previous studies (refer Figure 3.6), it can be seen that the results for this study for the sum of dioxin equivalent on a dry weight basis (reported as WHO-TEQ_{zero}) fall between the concentrations shown for agriculture and urban/industrial sediments, and appear different from the results reported from the Port Curtis investigation (EHP 2012).

Figure 3.5: Dioxin concentrations within East Banks Expansion DMPA

When the sum of dioxin and furan concentrations on a dry weight basis are compared against sediments from freshwater, estuarine and marine environments, and the previous Port Curtis study (refer Figure 3.7), the results fall between the estuarine and marine sediments and appear to be more similar to the marine values. This is in contrast to the previous Port Curtis study (EHP 2012), which appeared more similar to the estuarine sediments in terms of group total dioxin levels. This is likely due to the exposed outer harbour channel sediments in this investigation being more consistent with open marine sediments as opposed to the previous Port Curtis study, which included many of the upper tributaries and sheltered waters of Port Curtis with very few samples within the deeper exposed outer harbour channels.

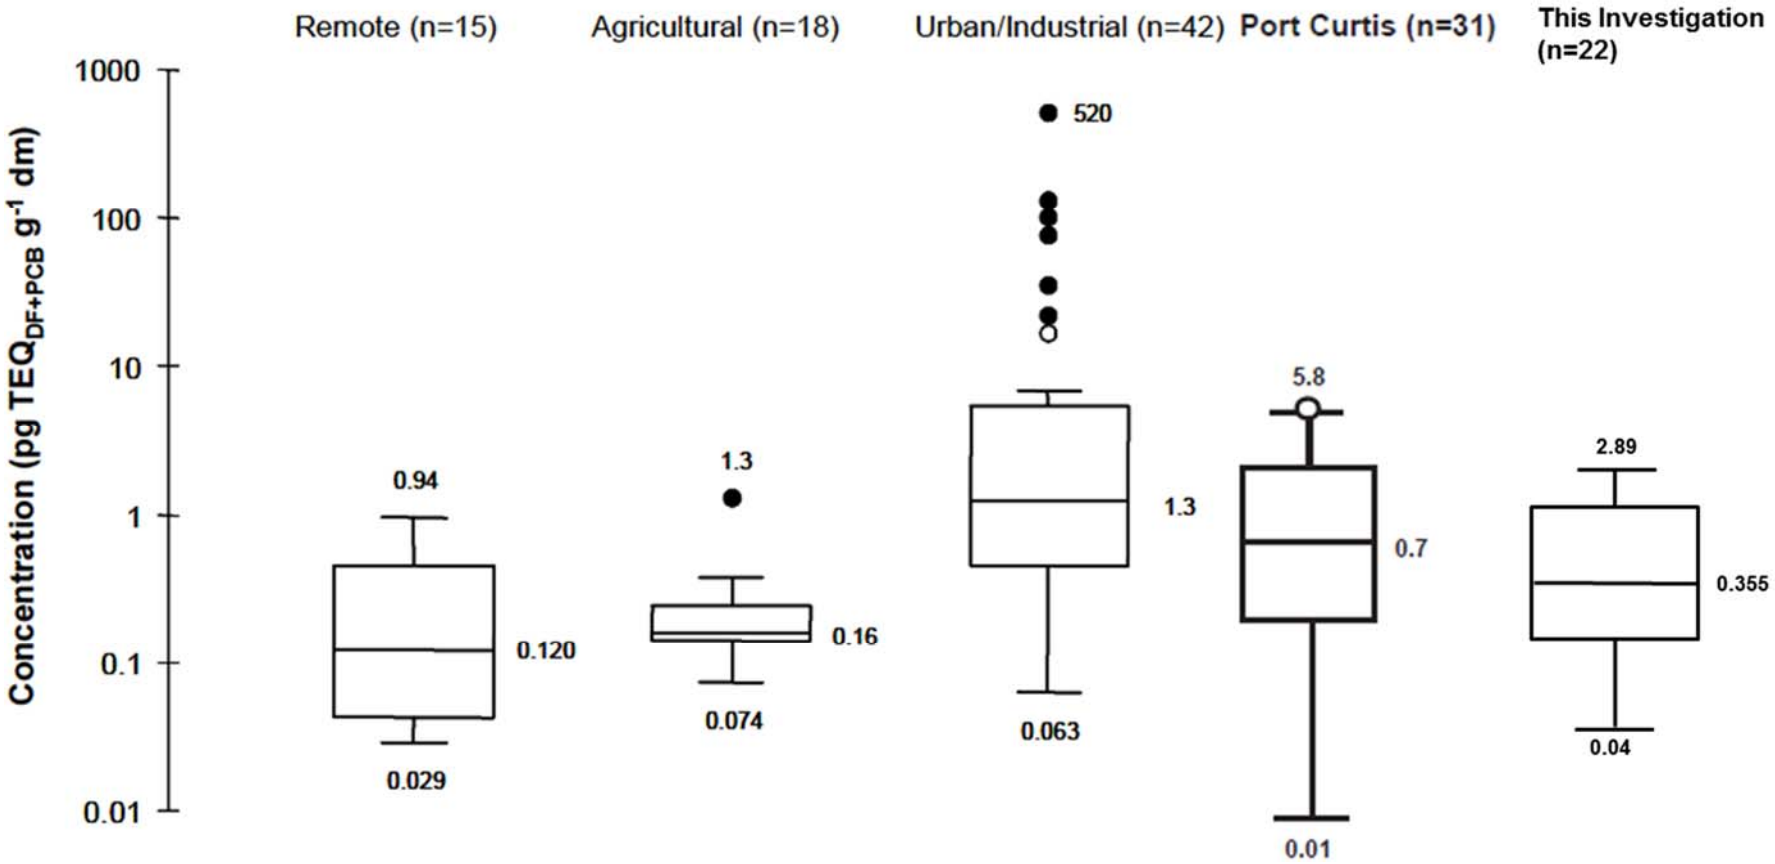

Figure 3.6 Box plot figures showing WHO-TEF values (calculated using zero for not detected dioxins)

Figure note: The first three box plots (remote, agriculture and urban/industrial) are adapted from the National Dioxins Program (Müller et al. 2004). The box plot labelled Port Curtis is taken from the EHP (2012) Port Curtis Study and the final boxplot illustrates the dioxin results across Port Curtis reported during this investigation. For interpretation of the box plots, refer to the National Dioxins Program (Müller et al. 2004).

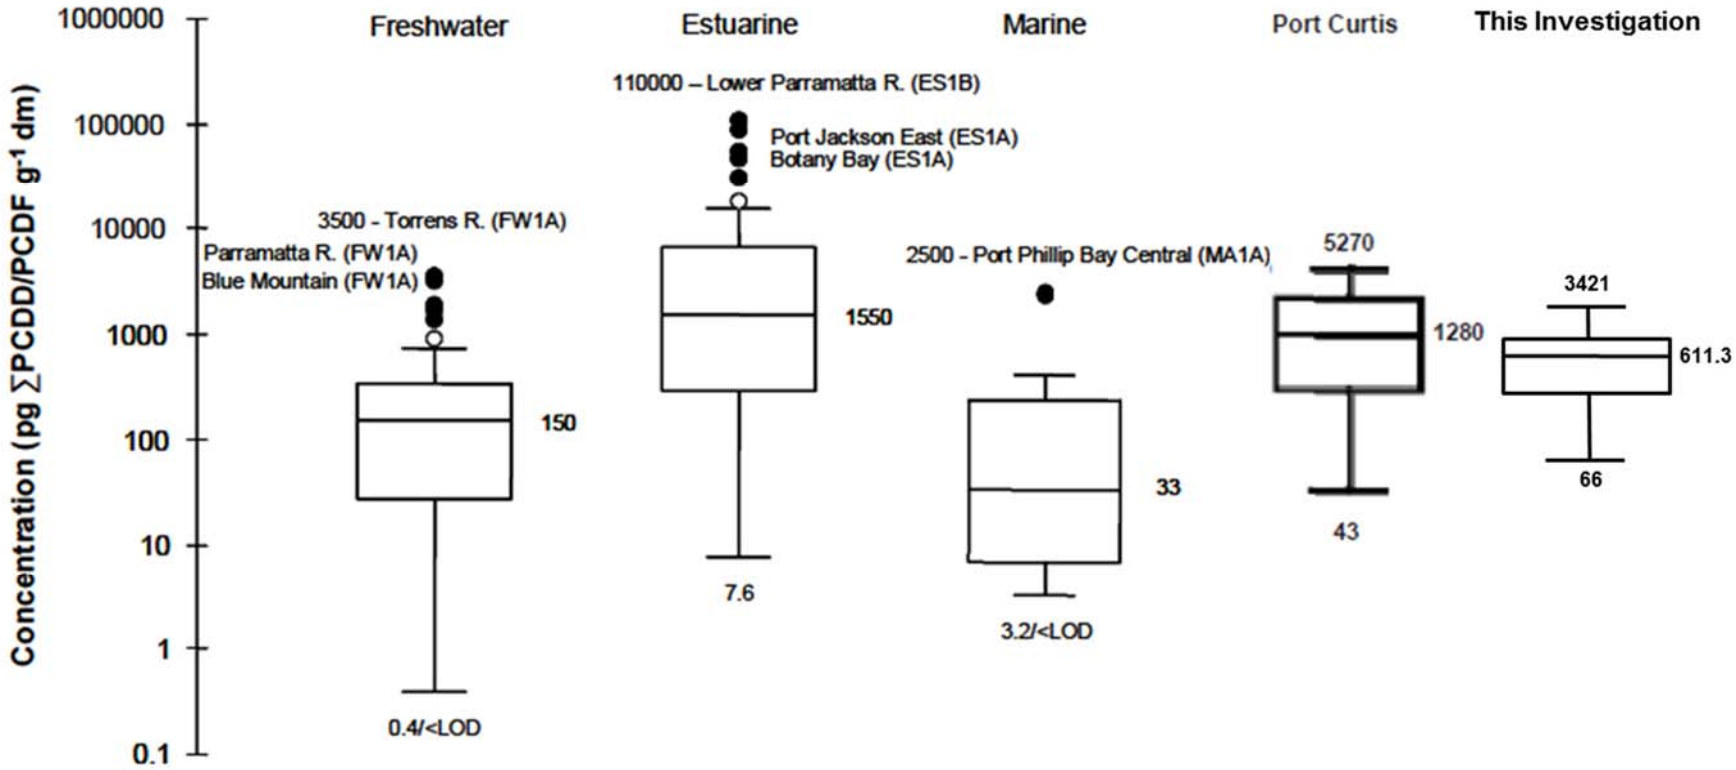

Figure 3.7 Box plot figures showing dioxin Group Total Concentrations pg/g

Figure note: The first three box plots (freshwater, estuarine and marine) are adapted from the National Dioxins Program (Müller et al. 2004). The box plot labelled Port Curtis is taken from the EHP (2012) Port Curtis Study and the final boxplot illustrates the dioxin results across Port Curtis reported during this investigation. For interpretation of the box plots, refer to the National Dioxins Program (Müller et al. 2004).

3.3 Particle size distribution

Particle size distribution (PSD) was analysed at 34 of the boreholes within East Banks Expansion DMPA, generally from the top 0.5m of sediment and from 0.5m to 1.0m where practicable.

The sediments within East Banks Expansion DMPA varied in texture with half the samples containing predominately fine material and the other half containing predominately coarse material. In addition, approximately 11.3% of samples collected were very coarse in texture, with combined sand, gravel and cobble proportion of over 90% while another 11.3% of samples contained over 90% of fines (i.e. clays and silts). These proportions do not significantly change with depth.

Figures 3.8 and 3.9 illustrate the PSD results across East Banks Expansion DMPA.

Table 3.2 outlines the PSD for the proposed East Banks Expansion DMPA, indicating that sand is the major component of the sediment (48.0%), although this is followed by clay (28.3%) and silt (20.0%).

Table 3.2 Summary of PSD results for East Banks Expansion DMPA

Statistics	Clay (<2 µm)	Silt (2-60 µm)	Sand (0.06-2mm)	Gravel (>2mm)	Cobbles (>6cm)
Minimum	2	<1	3	<1	<1
Mean	28.3	20	48.0	3.7	<1
Maximum	69	53	95	24	<1

All PSD laboratory results are included in Appendix G.

3.4 Acid sulfate soils

3.4.1 General

The full NATA certified laboratory report is provided in Appendix D while a summary of the results are provided in Appendix H.

The sections below discuss the ASS results and determine the likelihood of actual acid sulfate soils (AASS) and potential acid sulfate soils (PASS) being present in the sediment at East Banks Expansion DMPA.

The action criteria for ASS, as specified by Ahern et al. (1998) where more than 1,000 tonnes (t) of sediment is to be disturbed, is as follows:

- Sulfur trail 0.03% S
- Acidity trail 18 mole H+/t.

3.4.2 Field testing

3.4.2.1 Screening criteria

For reasons of practicality and the avoidance of transporting and using oxidising chemicals on board the vessel, the pH tests were conducted by the primary laboratory. The primary laboratory utilised two different methods for obtaining pH measurements depending on if the pH tests were stand-alone or part of the SPOCAS suite. The same pH results are achieved, regardless of the method utilised.

A typical value that may indicate the presence of AASS includes:

- A pH_F/pH_{KCL} value of 4 or less.

Coordinate system: GDA_1994_MGA_Zone_56

Figure 3.9: Particle Size Distribution (deeper sediments) – East Banks Expansion DMPA

Values that indicate the presence of PASS may include:

- A pH_{FOX}/pH_{OX} value of 4 or less
- A ΔpH greater than 2 (from pH_F to pH_{FOX} and pH_{KCL} to pH_{OX})
- To a much lesser extent, a 'vigorous' observed reaction rate.

3.4.2.2 Field and laboratory pH results

The pH test results provide an indication of the presence or absence of ASS in the sediment profile. The pH testing was conducted on each core, typically at 0.25m intervals along the core.

The pH tests were carried out on 143 sediment samples within East Banks Expansion DMPA. These tests were used to indicate the likelihood of sediment being non-ASS, AASS or PASS. The results of the pH testing are summarised as follows:

- The pH_F/pH_{KCL} values for all samples ranged from pH 6.2 to pH 10 indicating that AASS was not present at East Banks Expansion DMPA
- The results of the pH_{FOX}/pH_{OX} tests for all samples ranged from pH 2.0 to pH 10.2. The potential for the presence of PASS was identified at the following location:
  - EB26 0.75m: pH 2.0
- A drop in two or more pH units is considered potentially indicative of PASS presence in the sediment. This was observed in 25.9% of the sediment samples with a maximum drop in pH from EB26 0.75m.

Interpretation of the pH results indicated an absence of AASS across East Banks Expansion DMPA. PASS may be present in East Banks Expansion DMPA, given the drop in pH upon oxidation in a quarter of the samples.

3.4.3 SPOCAS results

The results for each component of the SPOCAS analysis methods are utilised as input into the acid base accounting, which is used to calculate the net acidity.

The acid base accounting takes into consideration the acid generating/neutralising capacity of the sediment in both its existing and disturbed states. It also includes consideration of potential for the sulfur material present in the sediment matrix to exchange with ions such as calcium and magnesium.

SPOCAS analysis was carried out on 91 sediment samples taken from within East Banks Expansion DMPA.

3.4.3.1 Acidity trail

The acidity trail component of the SPOCAS analysis is comprised of the following analytical methods:

- Titratable actual acidity (TAA) 23F (mole H+/t)
- Titratable peroxide acidity (TPA) 23G (mole H+/t)
- Titratable sulfidic acidity (TSA) 23H (mole H+/t).

These analytical methods assist in quantifying the level of acidity present within the sediment.

TAA quantifies the amount of existing acid in the sediment as measured in mole H^+/t. The expression of existing acidity within the sediment is generally indicated by the measured pH. TAA was not detected (<2 mole H^+/t) in all the samples.

TPA quantifies the amount of acid that is likely to be generated in the sediment if oxidation were to occur (e.g. during or as a result of disturbance). TPA was not detected (<2 mole H^+/t) in all the samples.

TSA quantifies the amount of acid (existing or potential) within the sediment that is attributable to pyritic material, which indicates the presence/absence of ASS material. TSA was not detected (<2 mole H^+/t) in all the samples.

3.4.3.2 Sulfur trail

The sulfur trail component of the SPOCAS analysis is comprised of the following analysis methods:

- Potassium chloride extractable sulfur (S_{KCl}) 23C (%S)
- Peroxide sulfur (S_P) 23D (%S)
- Peroxide oxidisable sulfur (S_{POS}) 23E (%S)
- Acidity – peroxide oxidisable sulfur (a-S_{POS}) a-23E (mole H+/t).

These analytical methods assist in quantifying the level of extractable sulfidic material present within the sediment, which includes soluble and adsorbed sulfate as well as sulfate from gypsum. These results are utilised as input into the acid base accounting for calculating the net acidity within the sediment attributable to the sulfur content available through oxidation.

S_{POS} was not detected (<0.02%S) in 41.8% of the samples. The maximum value for S_{POS} was 0.43%S, detected in EB35 at a depth of 0.5m. Approximately 58.2% of the samples were above the action criteria (≥ 0.03%S) and were observed in boreholes throughout East Banks Expansion DMPA.

3.4.3.3 Calcium values analysis

The calcium values analysis is comprised of the following analysis methods:

- KCl extractable calcium (Ca_{KCl}) method 23Vh (%Ca)
- Peroxide calcium (Ca_P) method 23Wh (%Ca)
- Acid reacted calcium (Ca_A) method 23X (%Ca).

These analysis methods assist in quantifying the level of extractable calcium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of calcium.

Ca_{KCl} results give an indication of the calcium that is soluble and exchangeable within the sediment. Ca_P results are utilised to calculate the reacted calcium (Ca_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable calcium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable calcium to calculate the acid reacted calcium. Results for Ca_{KCL} ranged from 0.09%Ca in EB7 (1.0m) to a maximum of 0.28%Ca in EB14 (1.0m).

3.4.3.4 Magnesium values analysis

The magnesium values analysis is comprised of the following analysis methods:

- KCl extractable magnesium (Mg_{KCl}) method 23Sm (%Mg)
- Peroxide magnesium (Mg_P) method 23Tm (%Mg)
- Acid reacted magnesium (Mg_A) method 23U (%Mg).

These analysis methods assist in quantifying the level of extractable magnesium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of magnesium.

Mg_{KCl} results give an indication of the magnesium that is soluble and exchangeable within the sediment. Mg_P results are utilised to calculate the reacted magnesium (Mg_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable magnesium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable magnesium in order to calculate the acid reacted magnesium. Results for Mg_{KCL} ranged between 0.03%Mg at EB21 (0.0m) and EB24 (0.0m) and 0.17%Mg in EB9 at a depth of 0.5m.

3.4.3.5 Excess acid neutralising capacity

All samples submitted to the laboratory for SPOCAS analysis were analysed for excess acid neutralising capacity (ANC_E). Results for ANC_E ranged from 0.36% $CaCO_3$ in EB7 (1.0m) to 43.5% $CaCO_3$ in EB1 (0.5m), indicating that the sediment throughout East Banks Expansion DMPA possesses acid neutralising capacity.

3.4.3.6 Acid base accounting

The acid base accounting analysis component of the SPOCAS analysis is comprised of the following calculations:

- Acid neutralising capacity (ANC) fineness factor (1.5)
- Net acidity (sulfur units) (%S)
- Net acidity (acidity units) (mole H+/t)
- Liming rate (kg $CaCO_3$/t).

The results of these calculations provide the information required for the development of sediment management measures for the placement of dredged material within East Banks Expansion DMPA, should dredged material placement disturb sediment when placed.

Net acidity (sulfur units) results for samples analysed were all below the LOR (<0.02%S). Net acidity (acidity units) results for samples analysed were all below the LOR (<10 mole H^+/t).

Based on laboratory results for net acidity, it is considered that the sediments within East Banks Expansion DMPA do not contain AASS and are unlikely to contain PASS.

4 West Banks Island DMPA

4.1 General

Borehole logs for each of the sampling locations are presented in Appendix B and photographs of each of the cores collected are provided in Appendix C.

All laboratory results and laboratory QA/QC assessments are provided in Appendix D for the primary laboratory (ALS) and Appendix E for the secondary laboratory (Eurofins).

4.2 Geochemical

A statistical summary of the geochemical results, showing an assessment against relevant guideline values identified in Section 1.5.1, is provided in Table 4.1 and Appendix F. Analyte concentrations detected above the guideline values are highlighted in bold, along with the relevant assessment criteria. Where guideline values are not available, a comparison against locally derived reference values and terrestrial background values has been undertaken.

The distribution of the contaminants of concern (and observed exceedances) was ubiquitous throughout the sediment profile sampled and the spread was across the DMPA indicating that the metals are widespread and naturally occurring. The analytical results and any exceedances are discussed in the following sections.

Sampling locations where guideline values have been exceeded are illustrated in Figures 4.1 to 4.4.

Table 4.1 Summary of geochemical results for the West Banks Island DMPA compared with guideline values

Table notes:
[1]Refers to exceedances over NAGD (2009) screening levels, the QLD contaminated land guideline value (EPA 1998) or the PCIMP (2011) EH values
[2]One detection only over NAGD PQL so the value of 0.8mg/kg has been utilised rather than calculating 95% UCL
[3]The distribution of the contaminants of concern (and observed exceedances) was ubiquitous throughout the sediment profile sampled and the spread was across the DMPA indicating that the metals are widespread and naturally occurring
Values in brackets are the median value
Bold indicates an exceedance of the corresponding guidance value

Figure 4.4: Distribution of elevated manganese within West Banks Island DMPA

4.2.1 Metals/metalloids

Aluminium, iron, arsenic, chromium, copper, cobalt, lead, manganese, nickel, selenium, vanadium and zinc were recorded above laboratory PQLs in every one of the 61 samples collected. One sample reported a level of cadmium over the LOR, five samples reported silver above the LOR and four samples of the 61 samples tested reported mercury over the laboratory LOR. No antimony over the laboratory LOR was detected.

The 95% UCL of all metals and metalloids considered as contaminants of concern under the NAGD (2009) for all samples were below the NAGD screening levels. However, the 95% UCL for manganese was 690.9mg/kg which is above the QLD Contaminated Land Guidelines EIL for manganese of 500mg/kg (EPA 1998).

A small number of arsenic, copper and nickel sample values demonstrated values slightly above the NAGD screening levels; however, none of these exceedances were recorded at levels greater than their respective NAGD high levels. Manganese however, was recorded within 34 samples at concentrations above its guideline value of 500mg/kg, which is discussed further below.

Metals with no NAGD screening level values (i.e. aluminium, iron, cobalt, manganese, selenium and vanadium) were compared against the locally derived reference values and terrestrial background values. While there were some exceedances over the locally derived reference values, none of the metals reported 95% UCLs over their respective PCIMP EH values.

No discussion has been presented for antimony as no concentrations were reported above the NAGD (2009) PQL.

4.2.1.1 Aluminium

Guideline values

No NAGD screening level values are available for aluminium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Aluminium was reported over the laboratory LOR within each of the 61 samples collected, with a minimum concentration of 3,330mg/kg from WBI3 at a depth of 2.9m to 3.0m, and a maximum concentration of 17,400mg/kg from WBI10 at a depth of 0.9m to 1.0m. When the results for aluminium are compared with the PCIMP EH value, only one of the 61 samples reported above the PCIMP EH value and the 95% UCL was 5,614mg/kg which is well below the PCIMP EH value of 15,000mg/kg.

Previous sediment investigations in Port Curtis recorded median aluminium concentrations of 8,770mg/kg (Angel et al. 2012) and 8,190mg/kg (GHD 2009). The median aluminium concentration recorded at West Banks Island DMPA (4,470mg/kg) is below these background values. The maximum aluminium concentration at West Banks Island DMPA also falls within the background range from the previous investigations.

4.2.1.2 Iron

Guideline values

No NAGD screening level values are available for iron and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Iron was reported over the laboratory LOR within each of the 61 samples collected with a minimum concentration of 7,990mg/kg from WB2 at a depth of 0.5m to 1.0m and a maximum concentration of 34,900mg/kg from WBI10 at a depth of 0.9m to 1.0m. When the results for iron are compared with the PCIMP EH value, four of the 61 samples reported concentrations above the PCIMP EH value, including:

- WB9 0.5m to 1.0m
- WBI10 0.9m to 1.0m
- WBI10 1.9m to 2.0m
- WBI10 2.9m to 3.0m.

The 95% UCL was 12,886mg/kg, which is well below the PCIMP EH value of 21,000mg/kg. The four samples which reported values above the PCIMP EH value were all recorded at depths greater than 0.5m which, along with the ubiquitous presence of iron throughout the Port Curtis sediments, indicates that the iron is naturally occurring.

Previous sediment investigations in Port Curtis recorded median iron concentrations of 17,450mg/kg (Angel et al. 2012) and 20,900mg/kg (GHD 2009). The median iron concentration recorded at West Banks Island DMPA (11,000mg/kg) is below both of these background values.

Iron concentrations in all samples at West Banks Island DMPA were within the background range for iron in Port Curtis derived by Angel et al. (2012) (4,970-62,600mg/kg) and recorded during the WBDDP (560-76,000mg/kg) (GHD 2009).

4.2.1.3 Arsenic

Guideline values

Arsenic was recorded above the PQL of 1.0mg/kg within each of the 61 samples collected, with 10 samples reporting levels above the NAGD screening level of 20mg/kg. The lowest concentration reported was 3.31mg/kg from WBI3 at a depth of 2.9m to 3.0m and the maximum was 25.3mg/kg from WB11 at a depth of 0.5m to 1.0m. No levels were recorded over the NAGD high level and the 95% UCL reported a value of 15.33mg/kg, which is below the NAGD screening level.

Arsenic has previously been demonstrated to occur naturally within Port Curtis at concentrations very close to ANZECC ISQG-low guidelines. Vicente-Beckett et al. (2006) showed via multivariate analyses that the concentrations of arsenic (as well as nickel and chromium) in the Port Curtis region are at natural background levels which are very close to the ANZECC ISQG-low guidelines (Vicente-Beckett et al. 2006).

Locally derived reference values

Given the 95% UCL for arsenic was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

4.2.1.4 Cadmium

Guideline values

Only one sample from WB9 at a depth of 0.5m to 1.0m reported a detection of cadmium over the NAGD PQL with a concentration of 0.8mg/kg. As such, this concentration was utilised rather than calculating a 95% UCL. This concentration is well below the NAGD screening level of 1.5mg/kg and NAGD high level of 10mg/kg.

Locally derived reference values

Given cadmium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.1.5 Chromium

Guideline values

Chromium was recorded above the NAGD PQL in all 61 samples with a minimum concentration of 6.4mg/kg from WB1 (0.0m to 0.5m) and maximum concentration of 23.7mg/kg from WBI10 (0.9m to 1.0m). No samples reported values above the NAGD screening level of 80mg/kg and the 95% UCL for all samples of 11.1mg/kg was significantly lower than the NAGD screening level of 80mg/kg.

Locally derived reference values

Given chromium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.1.6 Copper

Guideline values

Copper was recorded above the NAGD PQL in all 61 samples with one sample from WB9 at a depth of 0.5m to 1.0m exceeding the NAGD screening level of 65mg/kg (reporting a concentration of 66.1mg/kg). However, the 95% UCL of 11.57mg/kg is significantly lower than the NAGD screening level.

Locally derived reference values

Given the 95% UCL for copper was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

4.2.1.7 Cobalt

Guideline values

No NAGD screening level values are available for cobalt and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Cobalt was recorded over laboratory LORs in all 61 samples, with 13 of the 61 samples reporting over the PCIMP EH value of 6.9mg/kg. The minimum concentration of 2.8mg/kg was from WBI3 at a depth of 2.9m to 3.0m and the maximum concentration of 16.7mg/kg was from WBI10 at a depth of 0.9m to 1.0m. The 95% UCL of 6.83mg/kg was just below the PCIMP EH value.

All cobalt samples from West Banks Island DMPA were within the background range in Port Curtis, as recorded by Angel et al. (2012) and during the WBDDP (GHD 2009). In addition, the median concentration for cobalt at West Banks Island DMPA (6.2mg/kg) is below the medians from both Angel et al. (2012) and GHD 2009.

Terrestrial background values

The cobalt concentrations in all samples are within the terrestrial background values, which range from 2 to 170mg/kg (EPA 1998) and the median concentration is below the average abundance of cobalt in soil, as determined by AusIMM (2011).

4.2.1.8 Lead

Guideline values

Lead was recorded in all 61 samples above the NAGD PQL. No samples were recorded above the NAGD screening level of 50mg/kg and the highest concentration recorded was 10.7mg/kg from WBI10 from a depth of 0.9m to 1.0m, which is well below the NAGD screening level (as was the 95% UCL of 3.5mg/kg).

Locally derived reference values

Given lead was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.1.9 Manganese

Guideline values

No NAGD screening level values are available for manganese and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Manganese was reported above the NAGD PQL in all 61 samples at the West Banks Island DMPA with a minimum concentration of 82mg/kg from WBI3 (2.9m to 3.0m) and a maximum of 1,720mg/kg from WB5 (0.5m to 1.0m).

The median manganese concentration recorded at West Banks Island DMPA was 533mg/kg, which is greater than the corresponding median concentrations determined during the previous investigation by Angel et al. (2012) and during the WBDDP (GHD 2009). However, concentrations of manganese in the sediments of Port Curtis derived by Angel et al. (2012) and during the WBDDP (GHD 2009) were recorded up to 1,330mg/kg and 7,680mg/kg respectively. The 95% UCL for manganese at West Banks Island DMPA was 690.9mg/kg, which is reflective of background concentrations identified in previous investigations within Port Curtis.

Terrestrial background values

Manganese concentrations was reported over the 500mg/kg EIL in 34 of the 61 samples collected. The 95% UCL value of 690.9mg/kg was above the QLD Contaminated Land Guideline EIL of 500mg/kg.

While the sediments did report a 95% UCL higher than the 500mg/kg EIL, all manganese concentrations at West Banks Island DMPA were within the background levels provided by the draft QLD contaminated land guideline of 4-12,600mg/kg (EPA 1998).

In addition, given that the distribution of the exceedances occurred in both surface and deeper sediments, these are likely to be naturally occurring and are in line with levels previously reported within the Port Curtis area in previous studies.

The AusIMM (2011), *Field Geologist's Manual,* Fifth Edition, provides background ranges for various metals and metalloids in Australia, with an average abundance of 850mg/kg for manganese observed in Australian soils, which is greater than the 95% UCL for manganese at West Banks Island DMPA.

4.2.1.10 Nickel

Guideline values

Nickel was recorded over the NAGD PQL for all 61 samples collected with one sample from WBI10 from a depth of 0.9m to 1.0m reporting above the NAGD screening level of 21mg/kg with a concentration of 23.4mg/kg. The 95% UCL reported a value of 5.7mg/kg which is well below the NAGD screening level.

Locally derived reference values

Given the 95% UCL for nickel was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

4.2.1.11 Selenium

Guideline values

No NAGD screening level values are available for selenium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Selenium was detected above the laboratory LOR for all 61 samples although no samples reported concentrations over the PCIMP EH value of 1.0mg/kg. The minimum concentration was 0.1mg/kg from WBI3 at a depth of 2.9m to 3.0m while the maximum was 0.6mg/kg from WB9 at a depth of 0.5m to 1.0m. The 95% UCL of 0.34mg/kg was well below the PCIMP EH value.

In addition, sediment investigations during the WBDDP recorded concentrations of selenium ranging from 0.1-5.4mg/kg with a median concentration of 0.4mg/kg (GHD 2009). These results are similar to concentrations from West Banks Island DMPA, which recorded a median concentration of 0.3mg/kg.

4.2.1.12 Silver

Guideline values

Silver was detected above the NAGD PQL within five of the 61 samples analysed. However, no samples were recorded above the NAGD screening level of 1.0mg/kg and the maximum concentration recorded was 0.2mg/kg from WB13 at a depth of 0.0m to 0.5m.

Locally derived reference values

Given silver was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.1.13 Vanadium

Guideline values

No NAGD screening level values are available for vanadium and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Vanadium was detected above the laboratory LOR in all 61 samples, with four samples reporting concentrations above the PCIMP EH value of 40mg/kg (with the maximum concentration of 72.2mg/kg from WBI10 at a depth of 0.9m to 1.0m). All four of the samples over the PCIMP EH value were at depths below 0.5m. The 95% UCL was calculated at 31.82mg/kg, which is below the PCIMP EH value of 40mg/kg.

Angel et al. (2012) identified vanadium concentrations in sediments of Port Curtis ranging from 11 to 114mg/kg while vanadium concentrations in sediments ranged from 5.6 to 287mg/kg during the WBDDP (GHD 2009). The vanadium concentrations identified at West Banks Island DMPA had a very similar range with a lower median concentration of 27.7mg/kg and a 95% UCL (31.82mg/kg).

Terrestrial background values

In addition, AusIMM (2011) provides an average abundance value of 100mg/kg for vanadium observed in Australian soils. The maximum concentration of vanadium (72.2mg/kg) at West Banks Island DMPA is well below this value.

4.2.1.14 Zinc

Guideline values

Zinc was recorded above the NAGD PQL in all of the 61 samples collected with no exceedances recorded over the NAGD screening level of 200mg/kg. The minimum concentration of 11.3mg/kg was from WB2 at a depth of 0.5m to 1.0m while the maximum concentration recorded of 57.8mg/kg from WBI10 at a depth of 0.9m to 1.0m.

Locally derived reference values

Given zinc was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.1.15 Mercury

Guideline values

Mercury was recorded in four of the 61 samples at levels over the NAGD PQL, with all the elevated samples being located within deeper sediments (>0.5m). No exceedances were recorded over the NAGD screening level of 0.15mg/kg with a maximum concentration recorded of 0.04mg/kg from WB9 at a depth of 0.5m to 1.0m.

Locally derived reference values

Given mercury was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

4.2.2 Organics and BTEX

No PCBs, OCP or OPP concentrations were detected with all samples tested reporting below the laboratory LORs (and hence below guideline levels) for these contaminants.

Two of the 54 samples tested reported the sum of (11) PAHs above the laboratory LOR with the maximum concentration from WB7 at a depth of 0.0m to 0.5m reporting a value of 21µg/kg. This concentration is considerably below the NAGD screening level of 10,000µg/kg.

No TRH C_6-C_{10} fraction concentrations were detected although approximately two-thirds of the samples of the >C_{10}-C_{40} fraction above the NAGD PQL (34 values of 54 samples analysed). When adjusted to 1.0% TOC, the maximum concentration was 100mg/kg from WB8 at a depth of 0.0m to 0.5m with a 95% UCL of 39.48mg/kg, which is well below the NAGD screening level of 550mg/kg and the proposed Simpson et al. (2013) revised screening level of 280mg/kg.

Just under half the samples (24 samples from 54 samples) recorded TPH values over the LOR with the maximum concentration recorded being 80mg/kg (adjusted to 1.0% TOC) from WB8 at depths of 0.0m to 0.5m and 0.5m to 1.0m with the 95% UCL being 29.66mg/kg (adjusted to 1.0% TOC). BTEX was not detected above the laboratory LOR in any of the samples collected.

4.2.3 Organotins

No samples reported a concentration of tributyltin above the NAGD PQL of 1.0µg Sn/kg.

4.2.4 Nutrients and total organic carbon

No trigger limits exist for TOC and nutrients in sediments within the current NAGD (2009) guidelines although the PCIMP has set EH values derived from the 95th percentile of background data collected during the PCIMP monitoring with WCS values being set at 10 times the PCIMP EH values. The PCIMP EH and WCS values set for ammonia as N are 15mg/kg and 150mg/kg, respectively.

Simpson et al. (2013) (unpublished) provides revised sediment quality values, with a proposed screening level of 4.0mg/kg for ammonia.

All 61 samples for ammonia as N were recorded above the NAGD PQL of 0.1mg/kg with one sample recording ammonia above the PCIMP EH value of 15mg/kg with a value of 20.3mg/kg from WB8 at a depth of 0.5m to 1.0m. However, 17 samples recorded ammonia concentrations above the Simpson et al. (2013) screening level of 4.0mg/kg and the 95% UCL for ammonia, at 4.37mg/kg, also exceeded this screening level.

Sediment total ammonia as N concentrations are generally higher at locations with higher TOC and silt/clay content, compared to sites characterised by coarser material. The 95% UCLs for TOC and total ammonia as N were 0.17% and 4.37mg/kg, respectively, reflecting the relatively low clay content of most of the sampled locations, which comprised of approximately 90% of all samples being composed of >90% sand.

4.2.5 Dioxins

As previously discussed, minimal sampling for dioxins has been undertaken within Port Curtis to date. Two samples were collected within the West Banks Island DMPA itself (refer Figure 4.5). These results were analysed as part of the larger study as using the full 22 dioxin samples strengthened the analysis. The results were compared against the Canadian sediment quality guidelines and also compared against the previous Port Curtis investigation (EHP 2012). Details of this analysis are provided in Section 3.2.5.

4.3 Particle size distribution

PSD was analysed at all boreholes within the West Banks Island DMPA from the top 0.5m of sediment and from 0.5m to 1.0m.

The sediments within West Banks Island DMPA varied in texture with all samples containing sand material. In addition, approximately 88.9% of all samples collected containing over 90% of sand material. These proportions do not vary significantly with depth.

Figures 4.6 and 4.7 illustrate the PSD results across the West Banks Island DMPA.

Table 4.2 outlines the PSD for the West Banks Island DMPA, indicating that sand is the major component of the sediment with an average proportion of 94.1%.

Table 4.2 Summary of PSD results for West Banks Island DMPA

Statistics	Clay (<2 µm)	Silt (2-60 µm)	Sand (0.06-2mm)	Gravel (>2mm)	Cobbles (>6cm)
Minimum	1	<1	58	<1	<1
Mean	3.0	1.1	94.1	1.8	<1
Maximum	17	13	99	35	<1

All PSD laboratory results are included in Appendix G.

4.4 Acid sulfate soils

4.4.1 General

The full NATA certified laboratory report is provided in Appendix D while a summary of the results are provided in Appendix H.

The sections below discuss the ASS results and determine the likelihood of AASS and PASS being present in the sediment at West Banks Island DMPA.

The action criteria for ASS, as specified by Ahern et al. (1998) where more than 1,000t of sediment is to be disturbed, is as follows:

- Sulfur trail 0.03%S
- Acidity trail 18 mole H+/t.

4.4.2 Field testing

4.4.2.1 Screening criteria

For reasons of practicality and the avoidance of transporting and using oxidising chemicals on board the vessel, the pH tests were conducted by the primary laboratory. The primary laboratory utilised two different methods for obtaining pH measurements depending on if the pH tests were stand-alone or part of the SPOCAS suite. The same pH results are achieved, regardless of the method utilised.

Sediment Characterisation Plan Implementation Report (DMPAs)

Figure 4.7: Particle Size Distribution (deeper sediments) – West Banks Island DMPA

A typical value that may indicate the presence of AASS includes:

- A pH_F/pH_{KCL} value of 4 or less.

Values that indicate the presence of PASS may include:

- A pH_{FOX}/pH_{OX} value of 4 or less
- A ΔpH greater than 2 (from pH_F to pH_{FOX} and pH_{KCL} to pH_{OX})
- To a much lesser extent, a 'vigorous' observed reaction rate.

4.4.2.2 Field pH results

The pH test results provide an indication of the presence or absence of ASS in the sediment profile. The pH testing was conducted on each core, typically at 0.25m intervals along the core.

The pH tests were carried out on 142 sediment samples within West Banks Island DMPA. These tests were used to indicate the likelihood of sediment being non-ASS, AASS or PASS. The results of the pH testing are summarised as follows:

- The pH_F/pH_{KCL} values for the majority of samples ranged from pH 8.1 to pH 9.7 indicating that AASS were not present in the West Banks Island DMPA
- The results of the pH_{FOX}/pH_{OX} tests for all samples ranged from pH 6.2 to pH 10.7, indicating that PASS was not present in the sediment
- A drop in two or more pH units is considered potentially indicative of PASS presence in the sediment. This was observed in 2.8% of the sediment samples with the maximum drop in pH of 2.3 occurring in WB11 at a depth of 0.25m.

Interpretation of the pH results generally indicated an absence of ASS, including AASS and PASS, across the West Banks Island DMPA.

4.4.3 SPOCAS results

The results for each component of the SPOCAS analysis methods are utilised as input into the acid base accounting, which is used to calculate the net acidity.

The acid base accounting takes into consideration the acid generating/neutralising capacity of the sediment in both its existing and disturbed states. It also includes consideration of potential for the sulfur material present in the sediment matrix to exchange with ions such as calcium and magnesium.

SPOCAS analysis was carried out on 89 sediment samples taken from within the West Banks Island DMPA.

4.4.3.1 Acidity trail

The acidity trail component of the SPOCAS analysis is comprised of the following analytical methods:

- Titratable actual acidity (TAA) 23F (mole H+/t)
- Titratable peroxide acidity (TPA) 23G (mole H+/t)
- Titratable sulfidic acidity (TSA) 23H (mole H+/t).

These analytical methods assist in quantifying the level of acidity present within the sediment.

TAA quantifies the amount of existing acid in the sediment as measured in mole H^+/t. The expression of existing acidity within the sediment is generally indicated by the measured pH. TAA was not detected (<2 mole H^+/t) in all the samples.

TPA quantifies the amount of acid that is likely to be generated in the sediment if oxidation were to occur (e.g. during or as a result of disturbance). TPA was not detected (<2 mole H^+/t) in all the samples.

TSA quantifies the amount of acid (existing or potential) within the sediment that is attributable to pyritic material, which indicates the presence/absence of ASS material. TSA was not detected (<2 mole H^+/t) in all the samples.

4.4.3.2 Sulfur trail

The sulfur trail component of the SPOCAS analysis is comprised of the following analysis methods:

- Potassium chloride extractable sulfur (S_{KCl}) 23C (%S)
- Peroxide sulfur (S_P) 23D (%S)
- Peroxide oxidisable sulfur (S_{POS}) 23E (%S)
- Acidity – peroxide oxidisable sulfur (a-S_{POS}) a-23E (mole H+/t).

These analytical methods assist in quantifying the level of extractable sulfidic material present within the sediment, which includes soluble and adsorbed sulfate as well as sulfate from gypsum. These results are utilised as input into the acid base accounting for calculating the net acidity within the sediment attributable to the sulfur content available through oxidation.

S_{POS} was not detected (<0.02%S) in 77.5% of the samples. The maximum value for S_{POS} was 0.45%S, detected in WB5 at a depth of 1.0m. Approximately 13.5% of the samples were above the action criteria (≥0.03%S) and were observed in boreholes throughout the West Banks Island DMPA and at a range of depths.

4.4.3.3 Calcium values analysis

The calcium values analysis is comprised of the following analysis methods:

- KCl extractable calcium (Ca_{KCl}) method 23Vh (%Ca)
- Peroxide calcium (Ca_P) method 23Wh (%Ca)
- Acid reacted calcium (Ca_A) method 23X (%Ca).

These analysis methods assist in quantifying the level of extractable calcium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of calcium.

Ca_{KCl} results give an indication of the calcium that is soluble and exchangeable within the sediment. Ca_P results are utilised to calculate the reacted calcium (Ca_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable calcium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable calcium to calculate the acid reacted calcium. Results for Ca_{KCL} ranged from 0.12%Ca from WB9 (1.0m) to a maximum of 0.38%Ca in WB7 (0.5m).

4.4.3.4 Magnesium values analysis

The magnesium values analysis is comprised of the following analysis methods:

- KCl extractable magnesium (Mg_{KCl}) method 23Sm (%Mg)
- Peroxide magnesium (Mg_P) method 23Tm (%Mg)
- Acid reacted magnesium (Mg_A) method 23U (%Mg).

These analysis methods assist in quantifying the level of extractable magnesium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of magnesium.

Mg_{KCl} results give an indication of the magnesium that is soluble and exchangeable within the sediment. Mg_P results are utilised to calculate the reacted magnesium (Mg_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable magnesium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable magnesium in order to calculate the acid reacted magnesium. Results for Mg_{KCL} ranged between <0.02%Mg and 0.11%Mg in WB8 at a depth of 0.0m.

4.4.3.5 Excess acid neutralising capacity

All samples submitted to the laboratory for SPOCAS analysis were analysed for excess acid neutralising capacity (ANC_E). Results for ANC_E ranged from 0.72% $CaCO_3$ at WB7 (0.5m) to 14.7% $CaCO_3$ within ASS Duplicate 4 (WB4 1.0m).

4.4.3.6 Acid base accounting

The acid base accounting analysis component of the SPOCAS analysis is comprised of the following calculations:

- ANC fineness factor (1.5)
- Net acidity (sulfur units) (%S)
- Net acidity (acidity units) (mole H+/t)
- Liming rate (kg $CaCO_3$/t).

The results of these calculations provide the information required for the development of sediment management measures for the placement of dredged material within West Banks Island DMPA, should the existing sediment be disturbed during placement (or construction of a reclamation bundwall).

Net acidity (sulfur units) results for samples analysed were all below the LOR (<0.02%S). Net acidity (acidity units) results for samples analysed were all below the LOR (<10 mole H^+/t).

Based on laboratory results for net acidity, it is considered that the sediments within the West Banks Island DMPA do not contain AASS and are unlikely to contain PASS.

5 Port Central Expansion DMPA

5.1 General

Borehole logs for each of the sampling locations are presented in Appendix B and photographs of each of the cores collected are provided in Appendix C.

All laboratory results and laboratory QA/QC assessments are provided in Appendix D for the primary laboratory (ALS) and Appendix E for the secondary laboratory (Eurofins).

5.2 Geochemical

A statistical summary of the geochemical results, showing an assessment against relevant guideline values identified in Section 1.5.1 is provided in Table 5.1 and Appendix F. Analyte concentrations detected above the guideline values are highlighted in bold, along with the relevant assessment criteria. Where guideline values are not available, a comparison against locally derived reference values and terrestrial background values has been undertaken.

The distribution of the contaminants of concern (and observed exceedances) was ubiquitous throughout the sediment profile sampled and the spread was across the DMPA indicating that the metals are widespread and naturally occurring.

The analytical results and any exceedances are discussed in the following sections.

Sampling locations where guideline values have been exceeded are illustrated in Figures 5.1 to 5.3.

Table 5.1 Summary of geochemical results for Port Central Expansion DMPA compared with guideline values

Analytes (mg/kg)		Aluminium	Iron	Arsenic	Chromium	Copper	Cobalt	Lead	Manganese	Nickel	Selenium	Silver	Vanadium	Zinc	Mercury	Ammonia as N

Figure 5.3: Distribution of elevated manganese within Port Central Expansion DMPA

5.2.1 Metals/metalloids

Aluminium, iron, arsenic, chromium, copper, cobalt, lead, manganese, nickel, selenium, vanadium and zinc were recorded above laboratory PQLs in all 30 samples collected. Eight samples reported silver above the LOR and 24 of the 30 samples tested reported mercury over the laboratory LOR.

No metals considered as contaminants of concern under the NAGD (2009) reported values over the NAGD screening levels and the 95% UCL of all metals and metalloids were below the NAGD screening levels for all samples.

When comparing metals with no NAGD screening level (i.e. aluminium, iron, cobalt, selenium and vanadium) to the PCIMP EH values, there were some exceedances over the PCIMP EH values and cobalt, selenium and vanadium reported 95% UCLs over their respective PCIMP EH values.

Metals with no NAGD screening level values (i.e. aluminium, iron, cobalt, manganese, selenium and vanadium) were compared against the locally derived reference values and terrestrial background values. There were some exceedances over the PCIMP EH values, comparison to other background investigations in Port Curtis, such as Angel et al. (2012), GHD 2009 and Anastasi and Wilson (2010), indicated that a number of metals were naturally elevated within Port Curtis.

No discussion has been presented for antimony and cadmium as no concentrations were reported above the NAGD (2009) PQL.

5.2.1.1 Aluminium

Guideline values

No NAGD screening level values are available for aluminium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Aluminium was reported over the laboratory LOR in all 30 samples collected, with a minimum concentration of 3,850mg/kg from PCE3 at a depth of 1.95-2.05m and a maximum concentration of 21,800mg/kg from PC4 at a depth of 0.0m to 0.5m. When the results for aluminium were compared with the PCIMP EH value, three of the 30 samples reported above the PCIMP EH value and the 95% UCL was 11,912mg/kg, which is below the PCIMP EH value of 15,000mg/kg.

Previous sediment investigations in Port Curtis recorded median aluminium concentrations of 8,770mg/kg (Angel et al. 2012) and 8,190mg/kg (GHD 2009). The median aluminium concentration recorded at Port Central Expansion DMPA (10,750mg/kg) is greater than these background medians.

However, all aluminium samples from Port Central Expansion DMPA were within the background range for aluminium in Port Curtis derived by Angel et al. (2012) (1,720-26,900mg/kg) and only a single sample exceeded the background range recorded during the WBDDP (530-20,600mg/kg) (GHD 2009).

5.2.1.2 Iron

Guideline values

No NAGD screening level values are available for iron and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Iron was reported over the laboratory LOR within each of the 30 samples collected with a minimum concentration of 5,670mg/kg from PCE3 at a depth of 1.95-2.05m and a maximum concentration of 29,300mg/kg from PC7 at a depth of 0.5m to 1.0m. When the results for iron are compared with the PCIMP EH value, 11 of the 30 samples reported concentrations above the PCIMP EH value and the 95% UCL was 20,544mg/kg, which is slightly below the PCIMP EH value of 21,000mg/kg.

Previous sediment investigations in Port Curtis recorded median iron concentrations of 17,450mg/kg (Angel et al. 2012) and 20,900mg/kg (GHD 2009). The median iron concentration recorded at Port Central Expansion DMPA (17,150mg/kg) is consistent with these background values.

Iron concentrations in all samples at Port Central Expansion DMPA were within the background range for iron in Port Curtis derived by Angel et al. (2012) (4,970-62,600mg/kg) and recorded during the WBDDP (560-76,000mg/kg) (GHD 2009).

5.2.1.3 Arsenic

Guideline values

Arsenic was recorded above the PQL of 1.0mg/kg within each of the 30 samples collected, however none reported concentrations above the NAGD screening level of 20mg/kg. The minimum concentration reported was 2.7mg/kg from PCE3 at a depth of 1.95-2.05m and the maximum was 15mg/kg from PC11 at a depth of 0.0m to 0.5m. The 95% UCL reported a concentration of 11.4mg/kg, which is well below the NAGD screening level.

Locally derived reference values

Given all arsenic samples were below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

5.2.1.4 Chromium

Guideline values

Chromium was recorded above the NAGD PQL in all 30 samples with a minimum concentration of 10.3mg/kg from PCE3 at a depth of 3.95-4.05m and maximum concentration of 28.9mg/kg from PC7 at a depth of 0.5m to 1.0m. No samples reported values above the NAGD screening level of 80mg/kg and the 95% UCL for all samples of 19.22mg/kg was significantly lower than the NAGD screening level of 80mg/kg.

Locally derived reference values

Given chromium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

5.2.1.5 Copper

Guideline values

Copper was recorded above the NAGD PQL in all 30 samples with only one sample exceeding the NAGD screening level of 65mg/kg with a concentration of 67mg/kg from PCE1 at a depth of 2.9m to 3.0m. The minimum concentration of copper was 2.9mg/kg from PCE3 at a depth of 1.95-2.05m. The 95% UCL for copper was 20.75mg/kg, which is significantly below the NAGD screening level of 65mg/kg.

Locally derived reference values

Given the 95% UCL for copper was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

5.2.1.6 Cobalt

Guideline values

No NAGD screening level values are available for cobalt and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Cobalt was recorded over the laboratory LOR in all 30 samples, with 26 of the samples reporting over the PCIMP EH value of 6.9mg/kg. The minimum concentration of 2.1mg/kg was from PCE3 at a depth of 1.95-2.05m and the maximum concentration was 19.8mg/kg from PCE1 at a depth of 2.9m to 3.0m. The 95% UCL of 10.16mg/kg, while over the PCIMP EH value, was significantly under the PCIMP WCS value of 69mg/kg.

All cobalt samples from Port Central Expansion DMPA were within the background range in Port Curtis, as recorded by Angel et al. (2012) and during the WBDDP (GHD 2009). In addition, the median concentration for cobalt at Port Central Expansion DMPA (8.95mg/kg) is less than the median concentration identified by both Angel et al. (2012) and GHD (2009).

Terrestrial background values

The cobalt concentrations in all samples from Port Central Expansion DMPA are within the terrestrial background values, which range from 2 to 170mg/kg (EPA 1998) and the median concentration is similar to the average abundance of cobalt in soil (8mg/kg), as determined by AusIMM (2011).

5.2.1.7 Lead

Guideline values

Lead was recorded in all 30 samples above the NAGD PQL. No samples were recorded above the NAGD screening level of 50mg/kg. The maximum concentration recorded was 9.5mg/kg from PC4 at a depth of 0.0m to 0.5m, which is well below the NAGD screening level (as was the 95% UCL of 6.8mg/kg). The minimum concentration of lead recorded was 2.5mg/kg from PCE3 at a depth of 2.95-3.05m.

Locally derived reference values

Given lead was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

5.2.1.8 Manganese

Guideline values

No NAGD screening level values are available for manganese and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Manganese was reported above the NAGD PQL in all 30 samples at Port Central Expansion DMPA with a minimum concentration of 35mg/kg from PCE3 at a depth of 1.95-2.05m and a maximum concentration of 1,080mg/kg from PCE1 from a depth of 3.9m to 4.0m.

Investigations by Angel et al. (2012) and GHD (2009) recorded manganese concentrations ranging from 74-1,330mg/kg and 10-7,680mg/kg respectively. All manganese samples collected from Port Central Expansion DMPA fall within these ranges with a median of 290mg/kg, which is below the median of both previous investigations.

Terrestrial background values

Manganese was reported above the 500mg/kg EIL in only one sample of the 30 samples collected, with the sample taken at a depth of approximately 4.0m. The 95% UCL for manganese was 431.5mg/kg, which was below the QLD Contaminated Land Guideline EIL of 500mg/kg (EPA 1998).

All manganese samples collected from Port Central Expansion DMPA were within the background levels provided by the draft QLD contaminated land guideline of 4-12,600mg/kg (EPA 1998).

5.2.1.9 Nickel

Guideline values

Nickel was recorded over the NAGD PQL for all 30 samples collected with no samples reporting above the NAGD screening level of 21mg/kg. The 95% UCL reported a value of 10.41mg/kg, which is well below the NAGD screening level. The minimum concentration was 3.5mg/kg from PCE3 at a depth of 1.95-2.05m while the maximum concentration was 15.2mg/kg from PCE1 at a depth of 2.9m to 3.0m.

Locally derived reference values

Given all nickel samples were below the NAGD (2009) screening level, a comparison against locally derived reference values was not required.

5.2.1.10 Selenium

Guideline values

No NAGD screening level values are available for selenium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Selenium was detected above the laboratory LOR for all 30 samples with eight samples (from four boreholes) reporting concentrations over the PCIMP EH value of 1.0mg/kg. The minimum concentration was 0.1mg/kg from PCE3 at depths of 1.95-2.05m and 2.95-3.05m while the maximum was 4.5mg/kg from PC4 at a depth of 0.5m to 1.0m. The 95% UCL for selenium was 2.89mg/kg, nearly three times higher than the PCIMP EH value but significantly less than the PCIMP WCS value of 10mg/kg.

In addition, sediment investigations during the WBDDP recorded concentrations of selenium ranging from 0.1-5.4mg/kg with a median concentration of 0.4mg/kg (GHD 2009). These results are similar to concentrations from Port Central Expansion DMPA, which recorded a median concentration of 0.7mg/kg and a 95% UCL of 2.29mg/kg.

5.2.1.11 Silver

Guideline values

Silver was detected above the NAGD PQL within eight of the 30 samples. However, no samples were recorded above the NAGD screening level of 1.0mg/kg and the maximum concentration recorded was 0.9mg/kg from PC8 at a depth of 0.0m to 0.5m.

Locally derived reference values

Given silver was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

5.2.1.12 Vanadium

Guideline values

No NAGD screening level values are available for vanadium and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Vanadium was detected above the laboratory LOR in all 30 samples, with 14 of the samples reporting concentrations above the PCIMP EH value of 40mg/kg (with a maximum concentration of 98.3mg/kg from PCE1 at a depth of 3.9m to 4.0m). The 95% UCL for vanadium was calculated as 49.78mg/kg, which is above the PCIMP EH value of 40mg/kg but significantly below the PCIMP WCS value of 400mg/kg. There was no pattern to the distribution of vanadium within the different sample depths and when considered with the ubiquitous nature of its distribution around Port Curtis, indicates that the vanadium is natural in origin rather than an introduced contaminant.

In addition, Angel et al. (2012) identified vanadium concentrations in sediments of Port Curtis ranging from 11 to 114mg/kg while vanadium concentrations in sediments ranged from 5.6 to 287mg/kg during the WBDDP (GHD 2009). The vanadium concentrations identified at Port Central Expansion DMPA had a very similar range with a median concentration of 39.2mg/kg, consistent with the previous investigations.

Terrestrial background values

In addition, AusIMM (2011) provides an average abundance value of 100mg/kg for vanadium observed in Australian soils. All vanadium samples from sediments at Port Central Expansion DMPA were below this concentration.

5.2.1.13 Zinc

Guideline values

Zinc was recorded above the NAGD PQL in all of the 30 samples collected and no samples exceeded the NAGD screening level of 200mg/kg. The minimum concentration was 4.2mg/kg from PCE3 at a depth of 1.95-2.05m while the highest concentration was 55.2mg/kg from PC4 at a depth of 0.0m to 0.5m.

Locally derived reference values

Given zinc was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

5.2.1.14 Mercury

Guideline values

Mercury was recorded above the NAGD PQL in 24 of the 30 samples, with the samples being located across depth horizons. No exceedances were recorded over the NAGD screening level of 0.15mg/kg with the highest concentration being 0.04mg/kg from PC4 (0.0m to 0.5m) and PCE1 (3.9m to 4.0m).

Locally derived reference values

Given mercury was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

5.2.2 Organics and BTEX

No PCBs, OCP or OPP concentrations were detected with all samples tested reporting below the laboratory LORs (and hence below guideline levels) for these contaminants.

Fifteen of the 20 samples analysed reported the sum of (eleven) PAHs above the laboratory LOR. The maximum concentration was 1,910µg/kg (adjusted to 1.0% TOC) from PC11 at a depth of 0.0m to 0.5m with a 95% UCL of 865.8µg/kg, which is well below the NAGD screening level of 10,000µg/kg.

No TRH C_6-C_{10} fraction concentrations were detected although over three-quarters of the >C_{10}-C_{40} fraction recorded concentrations above the NAGD PQL (17 values of 20 samples analysed). When adjusted to 1.0% TOC, the maximum concentration was 340mg/kg from PC4 at a depth of 0.0m to 0.5m with a 95% UCL of 191mg/kg, which is well below the NAGD screening level of 550mg/kg and the proposed Simpson et al. (2013) revised screening level of 280mg/kg.

Seventeen from 20 samples recorded TPH concentrations over the LOR with the maximum concentration recorded being 300mg/kg (adjusted to 1.0% TOC) from PC5 at a depth of 0.0m to 0.5m with the 95% UCL being 175.3mg/kg (adjusted to 1.0% TOC). BTEX was not detected above the laboratory LOR in any of the samples collected.

5.2.3 Organotins

No samples reported a concentration of tributyltin above the NAGD PQL of 1.0µg Sn/kg.

5.2.4 Nutrients and total organic carbon

No trigger limits exist for TOC and nutrients in sediments within the NAGD (2009) guidelines although the PCIMP has set EH values derived from the 95th percentile of background data collected during the PCIMP monitoring with WCS values being set at 10 times the EH values. The PCIMP EH and WCS values set for ammonia as N are 15mg/kg and 150mg/kg, respectively.

Simpson et al. (2013) (unpublished) provides revised sediment quality values, with a proposed screening level of 4.0mg/kg for ammonia.

All 20 samples for ammonia as N were recorded above the NAGD PQL of 0.1mg/kg with six of the samples recording concentrations over the PCIMP EH value of 15mg/kg. The maximum concentration was 50.8mg/kg from PC5 at a depth of 0.5m to 1.0m. The 95% UCL had a value of 16.25mg/kg, just above the PCIMP EH value of 15mg/kg but well below the PCIMP WCS value of 150mg/kg.

However, 12 samples recorded concentrations in excess of the Simpson et al. (2013) screening levels. The 95% UCL for ammonia was 16.25mg/kg, which is significantly greater than the screening level.

Sediment total ammonia as N concentrations are generally higher at locations with higher TOC and silt/clay content, compared to sites characterised by coarser material. The 95% UCLs for TOC and total ammonia as N were 0.77% and 16.25mg/kg, respectively, reflecting an increase in the clay content (over 50% of samples) and a subsequent increase in ammonia concentration in the sediments.

5.2.5 Dioxins

As previously discussed, minimal sampling for dioxins has been undertaken within Port Curtis to date. Two samples were collected within the Port Central Expansion DMPA itself (refer Figure 5.4). These results were analysed as part of the larger study as using the full 22 dioxin samples strengthened the analysis. The results were compared against the Canadian sediment quality guidelines and also compared against the previous Port Curtis investigation (EHP 2012). Details of this analysis are provided in Section 3.2.5.

As dredged material will be placed in a reclamation, it is considered more appropriate to compare the results to the Dutch Intervention Levels for dioxins (1,000pg/g) (Ministry of Housing, Spatial Planning and the Environment 2000). As the median concentration (and maximum) are several orders of magnitude below the Dutch Intervention Level, no risk is likely to future site users of the reclamation.

5.3 Particle size distribution

PSD was analysed at 10 of the boreholes within the Port Central Expansion DMPA from the top 0.5m of sediment and from 0.5m to 1.0m where practicable.

The sediments within the Port Central Expansion DMPA were predominately sand and fine material (i.e. clay and silt) with 68% of the samples containing more coarse material. The amount of fine material increased with depth in the Port Central Expansion DMPA, with fine material contributing to 42.8% of the shallow sediment, which increased to 55.1% in the deeper sediments.

Figures 5.5 and 5.6 illustrate the PSD results across Port Central Expansion DMPA.

Table 5.2 outlines the PSD for Port Central Expansion DMPA, indicating that sand is the major component of the sediment (49.3%), followed by fines with a combined clay and silt average of 47.2%.

5.4 Acid sulfate soils

5.4.1 General

The full NATA certified laboratory report is provided in Appendix D while a summary of the results are provided in Appendix H.

The sections below discuss the ASS results and determine the likelihood of AASS and PASS being present in the sediment at Port Central Expansion.

The action criteria for ASS, as specified by Ahern et al. (1998) where more than 1,000t of sediment is to be disturbed, is as follows:

- Sulfur trail 0.03% S
- Acidity trail 18 mole H+/t.

5.4.2 Field testing

5.4.2.1 Screening criteria

For reasons of practicality and the avoidance of transporting and using oxidising chemicals on board the vessel, the pH tests were conducted by the primary laboratory. The primary laboratory utilised two different methods for obtaining pH measurements depending on if the pH tests were stand-alone or part of the SPOCAS suite. The same pH results are achieved, regardless of the method utilised.

A typical value that may indicate the presence of AASS includes:

- A pH_F/pH_{KCL} value of 4 or less.

Values that indicate the presence of PASS may include:

- A pH_{FOX}/pH_{OX} value of 4 or less
- A ΔpH greater than 2 (from pH_F to pH_{FOX} and pH_{KCL} to pH_{OX})
- To a much lesser extent, a 'vigorous' observed reaction rate

5.4.2.2 Field and laboratory pH results

The pH test results provide an indication of the presence or absence of ASS in the sediment profile. The pH testing was conducted on each core, typically at 0.25m intervals along the core.

The pH tests were carried out on 54 sediment samples within the Port Central Expansion DMPA. These tests were used to indicate the likelihood of sediment being non-ASS, AASS or PASS. The results of the pH testing are summarised as follows:

- The pH_F/pH_{KCL} values for the majority of samples ranged from pH 8.1 to pH 9.3 indicating that AASS were not present at the Port Central Expansion DMPA
- The results of the pH_{FOX}/pH_{OX} tests for all samples ranged from pH 2.4 to pH 9.2. The potential for the presence of PASS was identified at the following locations:
  - PC6 0.75m: pH 2.7
  - PC10 0.75m: pH 2.4

- PC10 1.0m: pH 2.8
- ASS Duplicate 24 (PC10 1.0m): pH 2.5

- A drop in two or more pH units is considered potentially indicative of PASS presence in the sediment. This was observed in 27.8% the samples with a reduction of greater than 5.5 pH units at the following locations:

  - PC6 0.75m: pH 5.8
  - PC10 0.75m: pH 5.7
  - PC10 1.0m: pH 5.9
  - ASS Duplicate 24 (PC10 1.0m): pH 6.2.

Interpretation of the field data generally indicated an absence of ASS across the majority of the Port Central Expansion DMPA. Selected samples from discrete locations and sediment horizons did however indicate a likely PASS presence at PC6 and PC10 at depths below 0.75m.

5.4.3 SPOCAS results

The results for each component of the SPOCAS analysis methods are utilised as input into the acid base accounting, which is used to calculate the net acidity.

The acid base accounting takes into consideration the acid generating/neutralising capacity of the sediment in both its existing and disturbed states. It also includes consideration of potential for the sulfur material present in the sediment matrix to exchange with ions such as calcium and magnesium.

SPOCAS analysis was carried out on 35 sediment samples taken from within the Port Central Expansion DMPA.

5.4.3.1 Acidity trail

The acidity trail component of the SPOCAS analysis is comprised of the following analytical methods:

- Titratable actual acidity (TAA) 23F (mole H+/t)
- Titratable peroxide acidity (TPA) 23G (mole H+/t)
- Titratable sulfidic acidity (TSA) 23H (mole H+/t).

These analytical methods assist in quantifying the level of acidity present within the sediment.

TAA quantifies the amount of existing acid in the sediment as measured in mole H^+/t. The expression of existing acidity within the sediment is generally indicated by the measured pH. TAA was not detected (<2 mole H^+/t) in all the samples.

TPA quantifies the amount of acid that is likely to be generated in the sediment if oxidation were to occur (e.g. during or as a result of disturbance). TPA was only detected at PC10 (1.0m) with a value of 272 mole H^+/t.

TSA quantifies the amount of acid (existing or potential) within the sediment that is attributable to pyritic material, which indicates the presence/absence of ASS material. TSA was only detected at PC10 (1.0m) with a value of 272 mole H^+/t.

5.4.3.2 Sulfur trail

The sulfur trail component of the SPOCAS analysis is comprised of the following analysis methods:

- Potassium chloride extractable sulfur (S_{KCl}) 23C (%S)
- Peroxide sulfur (S_P) 23D (%S)
- Peroxide oxidisable sulfur (S_{POS}) 23E (%S)
- Acidity – peroxide oxidisable sulfur (a-S_{POS}) a-23E (mole H+/t).

These analytical methods assist in quantifying the level of extractable sulfidic material present within the sediment, which includes soluble and adsorbed sulfate as well as sulfate from gypsum. These

results are utilised as input into the acid base accounting for calculating the net acidity within the sediment attributable to the sulfur content available through oxidation.

S_{POS} was detected all of the samples, ranging from 0.11%S to 1.5%S. The maximum value for S_{POS} was detected in PC10 at a depth of 1.0m while the minimum value was detected in PC1 at a depth of 0.0m. All samples analysed for Port Central Expansion DMPA exceeded the action criteria (≥ 0.03%S).

5.4.3.3 Calcium values analysis

The calcium values analysis is comprised of the following analysis methods:

- KCl extractable calcium (Ca_{KCl}) method 23Vh (%Ca)
- Peroxide calcium (Ca_P) method 23Wh (%Ca)
- Acid reacted calcium (Ca_A) method 23X (%Ca).

These analysis methods assist in quantifying the level of extractable calcium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of calcium.

Ca_{KCl} results give an indication of the calcium that is soluble and exchangeable within the sediment. Ca_P results are utilised to calculate the reacted calcium (Ca_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable calcium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable calcium to calculate the acid reacted calcium. Results for Ca_{KCL} ranged from 0.2%Ca in PC1 (1.0m) to a maximum value of 0.39%Ca in PC5 (0.0m).

5.4.3.4 Magnesium values analysis

The magnesium values analysis is comprised of the following analysis methods:

- KCl extractable magnesium (Mg_{KCl}) method 23Sm (%Mg)
- Peroxide magnesium (Mg_P) method 23Tm (%Mg)
- Acid reacted magnesium (Mg_A) method 23U (%Mg).

These analysis methods assist in quantifying the level of extractable magnesium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of magnesium.

Mg_{KCl} results give an indication of the magnesium that is soluble and exchangeable within the sediment. Mg_P results are utilised to calculate the reacted magnesium (Mg_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable magnesium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable magnesium in order to calculate the acid reacted magnesium. Results for Mg_{KCL} ranged between 0.06%Mg at PC1 (1.0m), PC2 (1.0m) and PC3 (0.5m) and 0.23%Mg in PC4 and PC5 at depths of 0.0m.

5.4.3.5 Excess acid neutralising capacity

The majority of samples submitted to the laboratory for SPOCAS analysis were analysed for ANC_E. Results for ANC_E ranged from 0.31% $CaCO_3$ from PC10 (0.5m) to 18% $CaCO_3$ in PC10 (0.0m), indicating that the sediment within the Port Central Expansion DMPA possesses acid neutralising capacity.

5.4.3.6 Acid base accounting

The acid base accounting analysis component of the SPOCAS analysis is comprised of the following calculations:

- ANC fineness factor (1.5)
- Net acidity (sulfur units) (%S)
- Net acidity (acidity units) (mole H+/t)
- Liming rate (kg $CaCO_3$/t).

The results of these calculations provide the information required for the development of sediment management measures for the placement of dredged material within Port Central Expansion, should the existing sediment be disturbed during placement (or construction of a reclamation bundwall).

Net acidity (sulfur units) results for samples analysed ranged from below the LOR (<0.02%S) to 0.81%S. Net acidity (acidity units) results for samples analysed ranged from below the LOR (<10 mole H^+/t) to 504 mole H^+/t. The maximum net acidity (sulfur and acidity units) was detected in ASS Duplicate 24 (PC10 1.0m).

Based on laboratory results for net acidity in sulfur units and acidity units, four sediment samples were above the action criteria and exhibited values indicative of the presence of ASS. These samples include PC7 (1.0m), PC10 (0.5m and 1.0m) and ASS Duplicate 24 (PC10 1.0m), and are presented in Figure 5.7

Figure 5.7: Acid Sulfate Soils within Port Central Expansion DMPA

6 Western Basin Expansion DMPA

6.1 General

Borehole logs for each of the sampling locations are presented in Appendix B and photographs of each of the cores collected are provided in Appendix C.

All laboratory results and laboratory QA/QC assessments are provided in Appendix D for the primary laboratory (ALS) and Appendix E for the secondary laboratory (Eurofins).

6.2 Geochemical

A statistical summary of the geochemical results, showing an assessment against relevant guideline values identified in Section 1.5.1 is provided in Table 6.1 and Appendix F. Analyte concentrations detected above the guideline values are highlighted in bold, along with the relevant assessment criteria. Where guideline values are not available, a comparison against locally derived reference values and terrestrial background values has been undertaken.

The distribution of the contaminants of concern (and observed exceedances) was ubiquitous throughout the sediment profile sampled and the spread was across the DMPA indicating that the metals are widespread and naturally occurring. The analytical results and any exceedances are discussed in the following sections.

Sampling locations where guideline values have been exceeded are illustrated in Figures 6.1 to 6.3.

Table 6.1 Summary of geochemical results for the Western Basin Expansion DMPA compared with guideline values

Figure 6.3: Metals reported above PCIMP Ecosystem Health values within Western Basin Expansion DMPA

6.2.1 Metals/metalloids

Aluminium, iron, arsenic, chromium, copper, cobalt, lead, manganese, nickel, selenium, vanadium, zinc and mercury were recorded above laboratory PQLs in all 41 samples undertaken. Twelve samples also reported silver above the LOR.

Of the metals considered as contaminants of concern under the NAGD (2009), only arsenic reported any values over the NAGD screening level (with four exceedances of the NAGD screening level) and the 95% UCL of all metals and metalloids for all samples were below the NAGD screening levels.

Metals with no NAGD screening level values (i.e. aluminium, iron, cobalt, manganese, selenium and vanadium) were compared against the locally derived reference values and terrestrial background values. There were exceedances observed over the PCIMP EH values with aluminium, iron, cobalt and vanadium reported 95% UCLs over their respective PCIMP EH values.

No discussion has been presented for antimony and cadmium as no values were reported above the NAGD (2009) PQL.

6.2.1.1 Aluminium

Guideline values

No NAGD screening level values are available for aluminium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Aluminium was reported over the laboratory LOR in all 41 samples collected, with a minimum concentration of 6,800mg/kg from WBE21 at a depth of 0.0m to 0.5m and a maximum concentration of 21,300mg/kg from WBE17 at a depth of 0.5m to 1.0m. When the results for aluminium were compared with the PCIMP EH value, 18 of the 41 samples reported concentrations above the PCIMP EH value and the 95% UCL was 15,374mg/kg which is slightly above the PCIMP EH value of 15,000mg/kg. There appears little relationship between depth horizon and distribution in relation to aluminium.

Previous sediment investigations in Port Curtis recorded median aluminium concentrations of 8,770mg/kg (Angel et al. 2012) and 8,190mg/kg (GHD 2009). The median aluminium concentration recorded at Western Basin Expansion DMPA (15,374mg/kg) is greater than these background values.

However, the 95% UCL was within the background ranges for aluminium from both investigations, although the maximum concentration recorded (21,300mg/kg) was slightly above the concentrations recorded during the WBDDP (GHD 2009).

6.2.1.2 Iron

Guideline values

No NAGD screening level values are available for iron and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Iron was reported over the laboratory LOR within each of the 41 samples collected with a minimum concentration of 14,800mg/kg from WBE11 at a depth of 0.0m to 0.5m and a maximum concentration of 81,000mg/kg from WBE19 at a depth of 0.0m to 0.5m. When the results for iron are compared with the PCIMP EH value, 34 of the 41 samples reported above the PCIMP EH value of 21,000mg/kg and the 95% UCL was 30,722mg/kg, which was higher than the PCIMP EH value although much lower than the PCIMP WCS value of 210,000mg/kg. There was no pattern to the distribution and iron appears to be widespread across the Western Basin Expansion DMPA.

Previous sediment investigations in Port Curtis recorded median iron concentrations of 17,450mg/kg (Angel et al. 2012) and 20,900mg/kg (GHD 2009). The median iron concentration recorded at Western Basin Expansion DMPA (26,100mg/kg) is greater than both these background values.

However, iron concentrations at Western Basin Expansion DMPA ranged from 14,800mg/kg to 81,000mg/kg, which is similar to the range recorded during the WBDDP (GHD 2009), indicating that elevated concentrations of iron are typical and widespread across Port Curtis.

6.2.1.3 Arsenic

Guideline values

Arsenic was recorded above the NAGD PQL of 1.0mg/kg within each of the 41 samples collected, with four samples reporting concentrations above the NAGD screening level of 20mg/kg. The minimum concentration reported was 3.1mg/kg from WBE11 at a depth of 0.0m to 0.5m and the maximum was 37.8mg/kg from WBE19 at a depth of 0.0m to 0.5m. The 95% UCL reported a value of 14.64mg/kg, which is well below the NAGD screening level.

Locally derived reference values

Given the 95% UCL for arsenic was below the NAGD (2009) screening level value, a comparison against locally derived reference values was not required.

6.2.1.4 Chromium

Guideline values

Chromium was recorded above the NAGD PQL in all 41 samples with a minimum concentration of 14.1mg/kg from WBE21 at a depth of 0.0m to 0.5m and maximum concentration of 37.2mg/kg from WBE19 at a depth of 0.0m to 0.5m. No samples reported concentrations above the NAGD screening level of 80mg/kg and the 95% UCL for all samples of 23.46mg/kg was significantly lower than the NAGD screening level of 80mg/kg.

Locally derived reference values

Given chromium was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

6.2.1.5 Copper

Guideline values

Copper was recorded above the NAGD PQL in all 41 samples with no samples exceeding the NAGD screening level of 65mg/kg. The minimum concentration was 10.8mg/kg from WBE9 at a depth of 0.0m to 0.5m, while the maximum concentration was 54.8mg/kg from WBE11 at a depth of 0.5m to 1.0m. The 95% UCL of 29.98mg/kg is significantly lower than the NAGD screening level.

Locally derived reference values

Given copper was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

6.2.1.6 Cobalt

Guideline values

No NAGD screening level values are available for cobalt and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Cobalt was recorded over laboratory LORs in all 41 samples, with all except three samples (totalling 38 samples) reporting over the PCIMP EH value of 6.9mg/kg. The minimum concentration was 2.1mg/kg from WBE19 at a depth of 0.0m to 0.5m and the maximum was 25.3mg/kg from WBE16 at a depth of 0.0m to 0.5m. The 95% UCL of 14mg/kg was over the PCIMP EH value but significantly under the PCIMP WCS value of 69mg/kg.

The background range determined during previous investigations recorded cobalt concentrations up to 31mg/kg (Angel et al. 2012) and 77.4mg/kg (GHD 2009). All cobalt concentrations recorded in

Western Basin Expansion DMPA are below these values. The median concentration of cobalt from this investigation (12.2mg/kg) is also similar to the medians determined during previous investigations.

Terrestrial background values

The cobalt concentrations in all samples are within the terrestrial background values, which range from 2 to 170mg/kg (EPA 1998) and the median concentration is similar to the average abundance of cobalt in soil (8mg/kg), as determined by AusIMM (2011).

6.2.1.7 Lead

Guideline values

Lead was recorded in all 41 samples above the NAGD PQL. No samples were recorded above the NAGD screening level of 50mg/kg and the highest concentration recorded was 12.9mg/kg from WBE20 at a depth of 0.0m to 0.5m, which is well below the NAGD screening level (as was the 95% UCL of 8.75mg/kg).

Locally derived reference values

Given lead was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

6.2.1.8 Manganese

Guideline values

No NAGD screening level values are available for manganese and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Manganese was reported above the NAGD PQL in all 41 samples at Western Basin Expansion DMPA with the minimum concentration of 49mg/kg from WBE19 at a depth of 0.0m to 0.5m and the maximum concentration of 472mg/kg from WBE11 at a depth of 0.5m to 1.0m. The 95% UCL value of 292.9mg/kg, which is slightly above the PCIMP EH value of 260mg/kg.

Background concentrations of manganese in the sediments of Port Curtis were recorded up to 1,330mg/kg (Angel et al. 2012) and 7,680mg/kg (GHD 2009). All manganese samples collected from Western Basin Expansion DMPA fall below these values.

Terrestrial background values

There were no manganese concentrations reported over the QLD Contaminated Land Guideline EIL of 500mg/kg within Western Basin Expansion DMPA.

6.2.1.9 Nickel

Guideline values

Nickel was recorded over the NAGD PQL within all 41 samples collected with no samples reporting above the NAGD screening level of 21mg/kg. The 95% UCL reported a value of 12.06mg/kg, which is well below the NAGD screening level. The minimum concentration was 1.8mg/kg from WBE19 at a depth of 0.0m to 0.5m while the maximum concentration was 18.2mg/kg from WBE15 at a depth of 0.5m to 1.0m.

Locally derived reference values

Given nickel was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

6.2.1.10 Selenium

Guideline values

No NAGD screening level values are available for selenium and as such, a comparison against locally derived reference values was conducted.

Locally derived reference values

Selenium was detected above the laboratory LOR for all 41 samples with 16 samples reporting concentrations above the PCIMP EH value of 1mg/kg. The minimum concentration was 0.6mg/kg from WBE3, WBE9 and WBE21 at a depth of 0.0m to 0.5m and the maximum was 1.5mg/kg from WBE20 at a depth of 0.0m to 0.5m. The 95% UCL was 0.96mg/kg which is just below the PCIMP EH value of 1.0mg/kg.

In addition, during the WBDDP selenium concentrations were detected in sediments ranging from 0.1-5.4mg/kg, with a median concentration of 0.4mg/kg (GHD 2009). While this is slightly below the median selenium concentration from Western Basin Expansion DMPA (0.9mg/kg), all selenium results collected fall within the range recorded during the WBDDP.

6.2.1.11 Silver

Guideline values

Silver was detected above the NAGD PQL within 12 of the 41 samples. However, no samples were recorded above the NAGD screening level of 1.0mg/kg and the maximum concentration recorded was 0.5mg/kg from WBE3 at a depth of 0.0m to 0.5m and WBE21 at a depth of 0.5m to 1.0m.

Locally derived reference values

Given silver was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

6.2.1.12 Vanadium

Guideline values

No NAGD screening level values are available for vanadium and as such, a comparison against locally derived reference values and terrestrial background values was conducted.

Locally derived reference values

Vanadium was detected above the laboratory LOR in all 41 samples, with 39 of the 41 samples reporting values above the PCIMP EH value of 40mg/kg. The minimum concentration was 35.2mg/kg from WBE3 at a depth of 0.0m to 0.5m while the maximum concentration was 172mg/kg from WBE19 at a depth of 0.0m to 0.5m. The 95% UCL was calculated at 65.53mg/kg which is above the PCIMP EH value of 40mg/kg but significantly below the PCIMP WCS value of 400mg/kg.

Angel et al. (2012) identified vanadium concentrations in sediments of Port Curtis ranging from 11 to 114mg/kg while vanadium concentrations in sediments ranged from 5.6 to 287mg/kg during the WBDDP (GHD 2009). The vanadium concentrations identified at Western Basin Expansion DMPA had a very similar distribution to those recorded during WBDDP, with a median concentration of 55.3mg/kg and a 95% UCL of 65.53mg/kg.

There was no pattern to the distribution of vanadium within the different sample depths and when considered with the ubiquitous nature of its distribution around Port Curtis, it is highly likely that the vanadium is natural in origin rather than an introduced contaminant.

Terrestrial background values

In addition, AusIMM (2011) provides an average abundance value of 100mg/kg for vanadium observed in Australian soils. The 95% UCL for vanadium (65.53mg/kg) at Western Basin Expansion DMPA is well below this value.

6.2.1.13 Zinc

Guideline values

Zinc was recorded above the NAGD PQL in all of the 41 samples collected and no exceedances were recorded over the NAGD screening level of 200mg/kg. The minimum concentration was 7.7mg/kg from WBE19 at a depth of 0.0m to 0.5m while the maximum concentration of zinc was 58.1mg/kg from WBE20 at a depth of 0.0m to 0.5m.

Locally derived reference values

Given zinc was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

6.2.1.14 Mercury

Guideline values

Mercury was recorded in all 41 samples at levels over the NAGD PQL, with the samples being located across all depth horizons. No exceedances were recorded over the NAGD screening level of 0.15mg/kg with the highest value being 0.06mg/kg from WBE15 (0.5m to 1.0m) and WBE20 (0.0m to 0.5m).

Locally derived reference values

Given mercury was below the NAGD (2009) screening level value in all samples, a comparison against locally derived reference values was not required.

6.2.2 Organics and BTEX

No PCBs, OCP or OPP concentrations were detected with all samples tested reporting below the laboratory LORs (and hence below guideline levels) for these contaminants.

Approximately one quarter (10) of the 41 samples analysed reported the sum of (11) PAHs above the laboratory LOR. The maximum concentration was 2,680µg/kg from WBE16 at a depth of 0.5m to 1.0m (adjusted to 1% TOC) with a 95% UCL of 609.5µg/kg, which is well below the NAGD screening level of 10,000µg/kg.

No TRH C_6-C_{10} fraction concentrations were detected, however all of the 41 samples of the >C_{10}-C_{40} fraction recorded concentrations over the NAGD PQL. When adjusted to 1.0% TOC, the maximum concentration was 3,850mg/kg from WBE11 at a depth of 0.5m to 1.0m with a 95% UCL of 927.6mg/kg, which is well above the NAGD screening level of 550mg/kg.

Only one sample, of the 41 samples collected, recorded TPH concentrations over the LOR of 3mg/kg with the maximum concentration recorded being 3,360mg/kg from WBE11 at a depth of 0.5m to 1.0m (adjusted to 1.0% TOC) with the 95% UCL being 798.1mg/kg (adjusted to 1.0% TOC). BTEX was not detected above the laboratory LOR in any of the samples collected.

It should be noted that the results for the TRHs and TPHs were made higher by the inclusion of one sample (WBE11 0.5m to 1.0m), which demonstrated the highest results for both of the oil fractions (3,850mg/kg and 3,360mg/kg adjusted to 1.0% TOC). If this sample outlier is excluded from the data, the 95% UCL for TRH (adjusted to 1.0% TOC) is 533.5mg/kg, and the 95% UCL for TPH (adjusted to 1.0% TOC) is 530.9mg/kg, both of which are below the NAGD screening level of 550mg/kg. The other sample taken from the 0.0m to 0.5m horizon at the same borehole also demonstrated elevated results for both TRHs and TPHs (1,210mg/kg and 1,060mg/kg adjusted to 1.0% TOC, respectively), which indicates that the borehole is likely a one-off hydrocarbon hotspot of unknown origin.

6.2.3 Organotins

No samples reported a concentration of tributyltin above the NAGD PQL of 1.0 µgSn/kg.

6.2.4 Nutrients and total organic carbon

No trigger limits exist for TOC and nutrients in sediments within the NAGD (2009) guidelines although the PCIMP has set EH values derived from the 95th percentile of background data collected during the PCIMP monitoring with WCS values being set at 10 times the PCIMP EH values. The PCIMP EH and WCS values set for ammonia as N are 15mg/kg and 150mg/kg, respectively.

Simpson et al. (2013) (unpublished) provides revised sediment quality values, with a proposed screening level of 4.0mg/kg for ammonia.

All 41 samples for ammonia as N were recorded above the NAGD PQL of 0.1mg/kg with only one sample recording an ammonia concentration above the PCIMP EH value of 15mg/kg with a concentration of 19.4mg/kg from WBE20 at a depth of 0.0m to 0.5m. The 95% UCL for ammonia as N was 7.41mg/kg, below the PCIMP EH value.

However, 33 samples recorded ammonia concentrations exceeding the Simpson et al. (2013) screening level of 4.0mg/kg. In addition, the 95% UCL for ammonia as N was 7.41mg/kg, which is in exceedance of the screening level.

The 95% UCLs for TOC and total ammonia as N were 2.37% and 7.41mg/kg, respectively, reflecting the high clay and silt content of the sediments within the Western Basin Expansion DMPA, where 80.5% of samples were mainly clay (42%) and silty (28%) compared with the other DMPAs.

6.2.5 Dioxins

As previously discussed, little sampling for dioxins has been undertaken within Port Curtis to date. A total of 22 samples were taken as part of this study across Port Curtis (although none were located within the Western Basin Expansion DMPA). The results were compared against the Canadian sediment quality guidelines and also compared against the previous Port Curtis investigation (EHP 2012). Details of this analysis are provided in Section 3.2.5.

As dredged material will be placed in a reclamation, it is considered more appropriate to compare the results to the Dutch Intervention Levels for dioxins (1,000pg/g) (Ministry of Housing, Spatial Planning and the Environment 2000). As the median concentration (and maximum) are several orders of magnitude below the Dutch Intervention Level, no risk is likely to future site users of the reclamation.

6.3 Particle size distribution

PSD was analysed at all boreholes within the Western Basin Expansion DMPA, generally from the top 0.5m of sediment and from 0.5m to 1.0m where practicable.

The sediments within the Western Basin Expansion DMPA comprised predominately fine material with 80.5% of samples containing mostly clays and silts. In addition, the top 0.5m of sediment sampled comprised 60.0% fine material, which increased to 79.9% at depth.

Figures 6.4 and 6.5 illustrate the PSD results across the Western Basin Expansion DMPA.

Table 6.2 outlines the PSD for the entire Western Basin Expansion DMPA, indicating that clay is the major component of the sediment (41.8%), followed by silt (27.9%) and sand (24.0%).

Table 6.2 Summary of PSD results for Western Basin Expansion DMPA

Statistics	Clay (<2 µm)	Silt (2-60 µm)	Sand (0.06-2mm)	Gravel (>2mm)	Cobbles (>6cm)
Minimum	20	8	2	<1	<1
Mean	41.8	27.9	24.0	6.3	<1
Maximum	74	46	56	31	<1

All PSD laboratory results are included in Appendix G.

Sediment Characterisation Plan Implementation Report (DMPAs)

Figure 6.5: Particle Size Distribution (deeper sediments) – Western Basin Expansion DMPA

6.4 Acid sulfate soils

6.4.1 General

The full NATA certified laboratory report is provided in Appendix D while a summary of the results are provided in Appendix H.

The sections below discuss the ASS results and determine the likelihood of AASS and PASS being present in the sediment at the Western Basin Expansion DMPA.

The action criteria for ASS, as specified by Ahern et al. (1998) where more than 1,000t of sediment is to be disturbed, is as follows:

- Sulfur trail 0.03%S
- Acidity trail 18 mole H+/t.

6.4.2 Field testing

6.4.2.1 Screening criteria

For reasons of practicality and the avoidance of transporting and using oxidising chemicals on board the vessel, the pH tests were conducted by the primary laboratory. The primary laboratory utilised two different methods for obtaining pH measurements depending on if the pH tests were stand-alone or part of the SPOCAS suite. The same pH results are achieved, regardless of the method utilised.

A typical value that may indicate the presence of AASS includes:

- A pH_F/pH_{KCL} value of 4 or less.

Values that indicate the presence of PASS may include:

- A pH_{FOX}/pH_{OX} value of 4 or less
- A ΔpH greater than 2 (from pH_F to pH_{FOX} and pH_{KCL} to pH_{OX})
- To a much lesser extent, a 'vigorous' observed reaction rate.

6.4.2.2 Field and laboratory pH results

The pH test results provide an indication of the presence or absence of ASS in the sediment profile. The pH testing was conducted on each core, typically at 0.25m intervals along the core.

The pH tests were carried out on 112 sediment samples. These tests were used to indicate the likelihood of sediment being non-ASS, AASS or PASS. The results of the pH testing are summarised as follows:

- The pH_F/pH_{KCL} values for the majority of samples ranged from pH 6.0 to pH 9.1 indicating that AASS were not present in the Western Basin Expansion DMPA
- The results of the pH_{FOX}/pH_{OX} tests for all samples ranged from pH 1.4 to pH 8.3. The potential for the presence of PASS ($pH_{FOX}/pH_{OX} < 4.0$) occurred in 48.2% of samples from the Western Basin Expansion DMPA, generally from samples collected at 0.75m or below.
- A drop in two or more pH units is considered potentially indicative of PASS presence in the sediment. This was observed in 61.6% of samples with a maximum reduction of 7.0 pH units in WBE15 1.0m. A drop of more than 6.0 pH units upon oxidation was observed in 21.4% of the samples collected with a 'vigorous' reaction rate observed.

Interpretation of the pH results generally indicated the presence of ASS across the majority of the Western Basin Expansion DMPA. While no samples exhibited the presence of AASS, almost all sampling locations indicated the presence of PASS at most depths below the surface.

6.4.3 SPOCAS results

The results for each component of the SPOCAS analysis methods are utilised as input into the acid base accounting, which is used to calculate the net acidity.

The acid base accounting takes into consideration the acid generating/neutralising capacity of the sediment in both its existing and disturbed states. It also includes consideration of potential for the sulfur material present in the sediment matrix to exchange with ions such as calcium and magnesium.

SPOCAS analysis was carried out on 71 sediment samples taken from within the Western Basin Expansion DMPA.

6.4.3.1 Acidity trail

The acidity trail component of the SPOCAS analysis is comprised of the following analytical methods:

- Titratable actual acidity (TAA) 23F (mole H+/t)
- Titratable peroxide acidity (TPA) 23G (mole H+/t)
- Titratable sulfidic acidity (TSA) 23H (mole H+/t).

These analytical methods assist in quantifying the level of acidity present within the sediment.

TAA quantifies the amount of existing acid in the sediment as measured in mole H^+/t. The expression of existing acidity within the sediment is generally indicated by the measured pH. TAA was not detected (<2 mole H^+/t) in all the samples, except WBE17 at a depth of 1.0m, with a TAA value of 8 mole H^+/t. These values are below the action criteria of 18 mole H^+/t for TAA.

TPA quantifies the amount of acid that is likely to be generated in the sediment if oxidation were to occur (e.g. during or as a result of disturbance). TPA ranged between not detected (<2 mole H^+/t) and 1,830 mole H^+/t. The maximum TPA value occurred at WBE8 (1.0m).

TSA quantifies the amount of acid (existing or potential) within the sediment that is attributable to pyritic material, which indicates the presence/absence of ASS material. TSA ranged between not detected (<2 mole H^+/t) and 1,830 mole H^+/t. The maximum TSA value occurred at WBE8 (1.0m).

6.4.3.2 Sulfur trail

The sulfur trail component of the SPOCAS analysis is comprised of the following analysis methods:

- Potassium chloride extractable sulfur (S_{KCl}) 23C (%S)
- Peroxide sulfur (S_P) 23D (%S)
- Peroxide oxidisable sulfur (S_{POS}) 23E (%S)
- Acidity – peroxide oxidisable sulfur (a-S_{POS}) a-23E (mole H+/t).

These analytical methods assist in quantifying the level of extractable sulfidic material present within the sediment, which includes soluble and adsorbed sulfate as well as sulfate from gypsum. These results are utilised as input into the acid base accounting for calculating the net acidity within the sediment attributable to the sulfur content available through oxidation.

S_{POS} was above the LOR in all samples. The maximum value for S_{POS} was 3.53%S, detected in WBE8 at a depth of 1.0m. All samples recorded S_{POS} values above the action criteria (≥ 0.03%S).

6.4.3.3 Calcium values analysis

The calcium values analysis is comprised of the following analysis methods:

- KCl extractable calcium (Ca_{KCl}) method 23Vh (%Ca)
- Peroxide calcium (Ca_P) method 23Wh (%Ca)
- Acid reacted calcium (Ca_A) method 23X (%Ca).

These analysis methods assist in quantifying the level of extractable calcium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of calcium.

Ca_{KCl} results give an indication of the calcium that is soluble and exchangeable within the sediment. Ca_P results are utilised to calculate the reacted calcium (Ca_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable calcium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable calcium to calculate the acid reacted calcium. Results for Ca_{KCL} ranged from 0.08%Ca to a maximum of 0.42%Ca in WBE10 (1.0m) and WBE18 (1.0m).

6.4.3.4 Magnesium values analysis

The magnesium values analysis is comprised of the following analysis methods:

- KCl extractable magnesium (Mg_{KCl}) method 23Sm (%Mg)
- Peroxide magnesium (Mg_P) method 23Tm (%Mg)
- Acid reacted magnesium (Mg_A) method 23U (%Mg).

These analysis methods assist in quantifying the level of extractable magnesium present within the sediment. These results are utilised as input into the calculation of the neutralising capacity within the sediment that is attributable to the presence of magnesium.

Mg_{KCl} results give an indication of the magnesium that is soluble and exchangeable within the sediment. Mg_P results are utilised to calculate the reacted magnesium (Mg_A), which indicates the acid neutralising capacity within the sediment that is attributable to the presence of soluble and exchangeable magnesium.

All samples submitted to the laboratory for SPOCAS analysis were analysed for the presence of soluble and exchangeable magnesium in order to calculate the acid reacted magnesium. Results for Mg_{KCL} ranged between 0.08%Mg and 0.33%Mg in WBE8 (1.0m) and WBE15 (1.0m).

6.4.3.5 Excess acid neutralising capacity

Approximately 54% of samples submitted to the laboratory for SPOCAS analysis were analysed for ANC_E. Results for ANC_E ranged from 0.35% $CaCO_3$ to 32.8% $CaCO_3$ in WBE10 (0.0m), indicating that the sediment within Western Basin Expansion possesses acid neutralising capacity.

6.4.3.6 Acid base accounting

The acid base accounting analysis component of the SPOCAS analysis is comprised of the following calculations:

- ANC fineness factor (1.5)
- Net acidity (sulfur units) (%S)
- Net acidity (acidity units) (mole H+/t)
- Liming rate (kg $CaCO_3$/t).

The results of these calculations provide the information required for the development of sediment management measures for the placement of dredged material within the Western Basin Expansion, should the existing sediment be disturbed during placement (or construction of a reclamation bundwall).

Net acidity (sulfur units) results for samples analysed ranged from below the LOR (<0.02%S) to 3.13%S. Net acidity (acidity units) results for samples analysed ranged from below the LOR (<10 mole H^+/t) to 1,950 mole H^+/t.

Based on laboratory results for net acidity in sulfur units and acidity units, 33 sediment samples (46.5%) were above the action criteria and exhibited values indicative of the presence of ASS at a range of depths. The sampling locations where the action criteria was exceeded are presented in Figure 6.6.

Sediment Characterisation Plan Implementation Report (DMPAs)

Figure 6.6: Acid Sulfate Soils within Western Basin Expansion DMPA

7 Data validation

7.1 Laboratory QA/QC

7.1.1 General

Details of the primary and secondary laboratory QA/QC are provided in Appendices D and E. A description of the laboratory QA/QC procedures implemented is provided in Section 2.7.

7.1.2 Sample conditions

All samples were received by the laboratories in appropriate sample containers that were pre-treated and preserved. Samples were stored in a chilled esky with ice bricks whilst in the field and were frozen upon receipt by the laboratory. All samples were delivered to the laboratories within the recommended holding times.

All samples were analysed within the recommended holding times, with the exception of the following:

- Nitrite as N:
  - RINSATE 2 (2 days overdue)
  - RINSATE 3 (1 day overdue)
  - RINSATE 4 (1 day overdue)
  - RINSATE 8 (4 days overdue)
  - RINSATE 10 (3 days overdue)
  - RINSATE 11 (1 day overdue)
  - RINSATE 12 (1 day overdue)
  - RINSATE 17 (4 days overdue)
  - RINSATE 18 (3 days overdue)
- Organotin compounds
  - RINSATE 2 (1 day overdue)
- TPH/TRH/BTEX:
  - PC9 0.0m to 0.3m A (1 day overdue)
  - TRIP BLANK 17 (8 days overdue).

Given the majority of samples were analysed within the recommended holding times and the above exceptions are generally for QA/QC purposes, it is considered that these samples conditions are acceptable.

7.1.3 Laboratory blanks

The assessment of the laboratory blank samples reported by ALS and Eurofins reported concentrations of all parameters below the LOR, indicating that the samples were not contaminated during laboratory analysis.

7.1.4 Laboratory duplicates

The assessment of laboratory duplicates is considered generally acceptable, although some exceedances of the NAGD recommended RPD of ±35% were recorded. These exceedances were recorded in the following analytes:

- Anonymous sample (4 February 2015):
  - Total Phosphorus as P
  - PAH
- PC5 0.0-0.5A:
  - PAH
- Anonymous sample (11 February 2015):
  - Total Phosphorus as P
- EB8 0.0-0.5A:
  - Manganese
- Anonymous sample (23 February 2015):
  - Copper
- EB22 0.0-0.5A:
  - Copper.

The remaining laboratory duplicates are compliant with the RPD criteria. Given the large volume of samples analysed and that only seven samples/analytes exceeded the RPD criteria, it is considered that the level of precision for the geochemical data is acceptable.

7.1.5 Surrogate and matrix spikes

The laboratory control spikes were within the recovery limits for all analytes, with the exception of organotins in a few samples, which were only slightly above the recommended limit and were considered to be within range of the laboratory's data quality objectives.

The percent recovery of matrix spikes for ammonia was not reported for some samples due to primary dilution requirements and the high ammonia concentrations in the samples. Matrix spike recovery for organotins (mainly, monobutyltin) was less than the NAGD criteria. However, this is not considered to be an issue given organotin concentrations were below the LOR in the actual samples. Matrix spike recovery for phosphorus was also slightly above the recovery limit in some instances.

Given these variations from the NAGD criteria were minor and the samples were below NAGD screening levels, it is considered that the surrogate and matrix spikes from the analysis are acceptable.

7.2 Field QA/QC

7.2.1 Trip blanks

Trip blank samples were utilised at a rate of one sample per day. The majority of trip blank results reported no concentrations above the LOR indicating negligible QA issues are evident in relation to the storage and transport of samples.

A single trip blank recorded a contaminant concentration for TRH slightly above the LOR. However, given the detected concentrations were significantly below NAGD screening levels, this result is considered negligible. QA/QC summary tables are provided in Appendix F.

7.2.2 Rinsates

Rinsate samples were collected at a rate of one sample per day from the sampling equipment after undergoing a standard decontamination. The majority of rinsate samples report no concentrations above the LOR indicating negligible QA issues are evident in relation to the decontamination process. QA/QC summary tables are provided in Appendix F.

However, some rinsates recorded a single contaminant concentration slightly above the LOR. These included:

- Monobutyltin:
  - Rinsate 2
- Manganese:
  - Rinsate 17
- Cadmium:
  - Rinsate 18
- Ammonia
  - Rinsate 7
  - Rinsate 8
  - Rinsate 10
  - Rinsate 11.

It should be noted that nine of the rinsate samples were analysed between one and four days beyond the recommended holding times, due to laboratory delays.

However, the detected concentrations in the rinsate were below the PQLs for these contaminants in sediment and for each rinsate, only a single contaminant exceeded the LOR. Therefore, these exceedances are considered negligible and as such, the rinsate results indicate an acceptable level of decontamination.

7.2.3 Field triplicates

Field triplicates were collected to determine the spatial variability in the physical and chemical characteristics of the sediments. The relative standard deviation (RSD) was calculated for each contaminant. NAGD (2009) recommends the RSD of field triplicates should fall within ±50%.

A total of 10 field triplicates were sampled within the DMPAs during the geochemical investigations. RSDs were calculated and reported within this threshold with the exception of the samples presented in Table 7.1. QA/QC summary tables are provided in Appendix F.

Table 7.1 Field triplicates exceeding the recommended RSD

Contaminant	Primary sample	Triplicate A	Triplicate B	RSD (%)
PC3 0.0-0.5m A				
Selenium	4.2	3.9	0.7	66.1
Ammonia as N	18.2	1.1	12.7	81.8
WB3 0.5-1.0m A				
The RSDs did not exceed 50% for the selected analytes				
PC6 0.0-0.5m A				
Silver	0.2	1.1	0.2	103.9
WB15 0.5-1.0m A, B				
Total organic carbon	0.39	0.24	0.13	51.5
Clay (<2 µm)	17	4	3	97.6
WB23 0.0-0.5m A				
Nitrate as N	<0.1	0.4	1	60.6
Nitrite + Nitrate as N	<0.1	0.4	1	60.6
Total Kjeldahl Nitrogen as N	160	70	70	52.0
Total Nitrogen as N	160	70	70	52.0
Ammonia as N	7.7	3.6	2.1	64.9
>C10 - C40 Fraction (sum)	3	4	8	52.9

Contaminant	Primary sample	Triplicate A	Triplicate B	RSD (%)
WBE6 0.0-0.5m A				
Total Kjeldahl Nitrogen as N	360	360	990	63.8
Total Nitrogen as N	360	360	990	63.8
Total Phosphorus as P	154	157	666	90.5
Ammonia as N	4.5	1.2	1.9	68.6
>C10 - C40 Fraction (sum)	20	5	21	58.5
WBE12 0.0-0.5m A				
Total organic carbon	2.92	1.04	1.51	53.7
EB10 0.0-0.5m A				
C10 - C36 Fraction (sum)	7	<3	<3	53.3
EB26 0.0-0.5m A				
Total organic carbon	0.04	0.09	0.03	60.3
EB32 0.0-0.5m A				
Lead	10.1	3.5	4.5	59.0
Selenium	0.5	1.9	3.2	72.3
Vanadium	74.4	22	31.1	65.9

A total of 22 field triplicate results (out of 566 field triplicate results) exceeded the recommended target RSD, which equates to 3.9% of the total field triplicate results. However, these exceedances are likely due to the variation in particle and grain sizes of the sediments, low analyte concentrations and variability in organic analyte concentrations. Therefore, it is considered that there was adequate precision from sample collection, handling and the primary laboratory analytical techniques.

7.2.4 Inter-laboratory duplicates

Inter-laboratory duplicates were collected to assess variation between the laboratories. The primary laboratory (ALS Environmental) analysed the Duplicate A samples while the secondary laboratory (Eurofins) analysed the Duplicate B samples.

The RSD was calculated for each contaminant. NAGD (2009) recommends the RSD of inter-laboratory duplicates should fall within ±50%. RPDs were calculated where the secondary laboratory had a greater LOR than the primary sample or in the instances where a contaminant was not analysed by the secondary laboratory.

A total of five inter-laboratory duplicates were sampled within the DMPAs during the geochemical investigation. RSDs were calculated and reported within this threshold with the exception of the samples presented in Table 7.2. QA/QC summary tables are provided in Appendix F.

Table 7.2 **Inter-laboratory duplicates exceeding the recommended RSD**

Contaminant	Primary sample	Duplicate A	Duplicate B	RSD/RPD (%)
PC4 0.0-0.5m A				
Silver	<0.1	1.1	0.1	118
Nitrate as N	0.1	0.1	0.8	121
TRH >C10 - C16	4	5	57	138
TPH C15 - C28	14	12	87	114
TPH C29 - C36	11	10	52	99
TPH C10 - C36 (sum)	29	26	140	100
WB18 0.0-0.5m A				
Lead	2.6	2.9	14	100
Ammonia as N	1.8	1.8	6.4	80
WBE18 0.5-1.0m A				
Nitrate as N	<0.1	0.1	0.9	113
EB25 0.0-0.6m A				
Aluminium	18,700	4,930	-	116.5
Iron	28,400	13,000	-	74.4
Copper	25.6	2.4	2.8	129.4
Lead	9.5	3	3	72.6
Nickel	13.5	4.3	4.9	68.0
Vanadium	61.4	26.2	-	80.4
Zinc	37.1	11.1	13	71.0
EB14 0.0-0.5m A				
Aluminium	21,200	7,800	-	92.4
Iron	34,100	14,500	-	80.7
Copper	35.8	8.1	24	61.4
Cobalt	13.1	5.8	-	77.2
Nickel	21.3	6.9	< 10	59.5
Selenium	0.9	0.4	-	76.9
Vanadium	73	35	-	70.4
Zinc	67.1	19.5	40	56.6
Ammonia as N	2.2	0.2	3.8	87.3

A total of 25 inter-laboratory duplicate results (out of 224 inter-laboratory results) exceeded the recommended target RSD and RPD, which equates to approximately 11.2% of the total inter-laboratory duplicate results. However, these exceedances are likely due to the variation in particle and grain sizes of the sediments, the low analyte concentrations and variability in organic analyte concentrations. Therefore, it is considered that there is adequate consistency between the laboratories, including handling and analytical techniques.

7.2.5 Acid sulfate soil duplicates

Duplicate ASS samples were collected to assess the variability and precision of both the sampling procedure and the analytical laboratory. The RPD was calculated for each ASS parameter and is recommended to fall within the following limit:

- For values < 10 x LOR, any RPD value is acceptable
- For values between 10 and 20 times LOR, 0% to 50% RPD is acceptable
- For values > 20 times LOR, 0% to 20% is acceptable.

A total of 34 ASS duplicates were sampled within the DMPAs during the geochemical investigation. RPDs were calculated and reported within the threshold with the exception of the samples presented in Appendix I.

While 149 ASS duplicate results fell outside the recommended RPD limits, this equates to approximately 15.1% of the total ASS duplicate results within the DMPAs.

As such, the review of the ASS duplicates indicated an overall consistency between primary and duplicate samples suggesting adequate precision from sample collection, handling and laboratory analytical techniques.

7.3 Summary of data validation

A total of 22 field triplicate results and 25 inter-laboratory duplicate results exceeded the recommended target RSD. These exceedances are likely due to the inherent heterogeneity of the sediment samples (i.e. variable mixture of particles and grain sizes). Higher variations can also be expected for samples with low analyte concentrations and higher for organic analytes than for inorganics.

The laboratory and field QA/QC are considered to comply with the NAGD requirements. The analytical results are therefore considered representative of the physical and chemical characteristics of the sediment.

Aurecon deems the quality of the analytical component for this geochemical investigation acceptable.

8 Discussion and conclusions

8.1 Discussion

Sediment sampling was undertaken in order to characterise the geochemical and physical nature of the sediments at four potential dredged material placement sites within Port Curtis. These sites included:

- East Banks Expansion DMPA (at sea)
- West Banks Island DMPA
- Port Central Expansion DMPA
- Western Basin Expansion DMPA.

These potential DMPAs varied in their sediment types, which ranged from clay and silt dominated sediments through to sand dominated sediments.

Where guideline value exist under NAGD (2009), an assessment against these was undertaken. Where no values are present under NAGD (2009), a comparison against locally derived reference values and other locally derived reference data (equivalent to the NAGD (2009) term regional ambient baseline levels) was undertaken.

Generally, the chemical composition across all four DMPAs within the marine investigation area demonstrated low levels of contaminants of concern and very few exceedances of the NAGD (2009) screening levels for contaminants of concern, including metals, metalloids and organics. All sites showed similar characteristics in having low levels (i.e. greater than laboratory PQLs/LORs but lower than NAGD screening levels or locally derived reference values) of many metals, including arsenic, chromium, copper, lead, nickel, selenium, vanadium, zinc and mercury. The distribution of these metals was ubiquitous throughout the sediment profile sampled and the spread was across the four DMPAs indicating that these metals are widespread and naturally occurring.

The difference in sediment types did result in differences between the chemical composition of the sediments within the DMPAs. Those with clay dominated sediments demonstrated higher aluminium, iron and ammonia (as N) concentrations and those with more mixed sediments having lower nutrients and TOC and higher manganese concentrations.

No PCBs, organotins or pesticides were detected above laboratory LORs within any sample from any DMPA. However, the opposite was true of the hydrocarbons with PAHs, TRHs and TPHs being widespread both spatially and vertically at low concentrations at all DMPAs, although no BTEX were detected during the investigation.

Generally, most samples recorded hydrocarbons concentrations below the NAGD screening level although at Western Basin Expansion DMPA, two samples within one borehole were reported with what appears to be a 'hotspot' of hydrocarbon contamination. This borehole demonstrated TRH and TPH concentrations of 3,850 and 3,360mg/kg, respectively (nearly six times over the NAGD screening level of 550mg/kg) and contributed significantly to the 95% UCL being greater than the NAGD screening level. If the 'hotspot' outliers are removed from the calculation, the 95% UCL falls below the NAGD screening level for both TRH and TPHs. The other sample taken from the same borehole also demonstrated elevated concentrations making it highly likely that this is a one-off hotspot of unknown origin. Management strategies will be outlined in the Project Environmental Management Plan.

Both the West Banks Island DMPA and East Banks Expansion DMPA demonstrated a number of exceedances of metals over their NAGD screening levels (namely arsenic, copper and nickel) although their 95% UCLs were below the respective NAGD screening levels. It may be that this relationship is linked to both sites having higher proportion of sandy sediments (especially the case at the West Banks Island DMPA).

The presence of ASS varied between the DMPAs. Samples from East Banks Expansion DMPA and West Banks Island DMPA did not contain AASS and sediments are unlikely to contain PASS, mainly due to the higher proportion of sand at these locations. At Port Central Expansion DMPA, acidity was detected within some samples at depths of 0.5m and greater. At Western Basin Expansion DMPA, ASS was widespread throughout the site both laterally and vertically. Management measures will be developed in the Project ASS Management Plan.

8.2 Conclusions

Geochemical results from this investigation have demonstrated that the sediment from the DMPAs have low concentrations of metals distributed throughout the sediment profile, and despite the exceedances of screening levels for some contaminants in some samples, overall, the sediments would be considered **clean** as per NAGD (2009).

Given the sediments from the area to be dredged are also **clean** as per NAGD (2009), as reported in the Sampling and Analysis Plan Implementation Report (area to be dredged) (Aurecon 2015), the DMPAs are considered to be chemically suitable to receive dredged material from the area to be dredged. Further testing such as elutriates and bioavailability testing is not required.

The appraisal of laboratory and field QA/QC procedures and assessments indicates that the results comply with the NAGD (2009) requirements. The analytical results are therefore representative of the physical and chemical characteristics of the sediment.

Compliance of the Project geochemical investigation with the approved SCP and NAGD (2009) is demonstrated by:

- Drilling and sampling has been undertaken to full depth of sediment that has the potential to be contaminated and is considered to have potential to interact with the dredged material. The vibrocorer achieved refusal in consolidated natural geological materials (i.e. rock, dense sands/gravels or stiff to very stiff clays).
- Sampling used a vibrocoring process, a NAGD recognised approved device for undertaking geochemical sampling
- Additional sediment sampling and laboratory analysis for metals and metalloids was undertaken in the underlying consolidated natural geological materials, in conjunction with the geotechnical investigation in four additional locations (two locations in West Banks Island DMPA and two locations in Port Central Expansion DMPA) to collect information on metals and metalloids that have previously been demonstrated to be naturally occurring within Port Curtis.

1 Introduction

1.1 Background

The Port of Gladstone has been identified by the Queensland Government as a major industrial centre for the future of Australia. It is Queensland's largest multi-commodity port, the world's fifth largest coal export terminal, and one of the busiest ports in Australia, vital to the local, state and national economies. Major exports from the port include coal, alumina, cement, petroleum, aluminium and agricultural resources. It is estimated that 250-300 million tonnes of product will be handled annually by the Port within the next 50 years (GPC 2012).

The introduction of the Liquefied Natural Gas (LNG) industry to the Gladstone region and the commencement of the Wiggins Island Coal Export Terminal (WICET) will substantially increase the throughput of the Port of Gladstone in the near future.

The current ability of the Port to accommodate high volumes of shipping traffic is limited by the channel depth and lack of passing capacity in the one way channel. Due to increasing development pressures and access demands from present and future Port developments, there is a need to duplicate the channel to support the growth of the Gladstone region.

The duplicate channel is proposed to be developed parallel to the existing Gatcombe and Golding shipping channels, facilitating a two-way rite of passage from the outer harbour, around East Banks, to the western side of Facing Island. This will release a bottleneck which will likely result with the increase in the total number of vessels handled annually in order to meet the committed trade.

1.2 Channel duplication and subsequent dredge material placement options

A Sediment Analysis Plan under the National Assessment Guidelines for Dredging (NAGD) (2009) for the characterisation of the sediments relating to the channel duplication dredge footprint has been prepared and submitted to the Regulatory Authorities separately.

This document outlines the investigation proposed to characterise the sediments at the potential dredge material placement areas (DMPAs), three of which are currently being investigated as part of the Environmental Impact Statement (EIS) for dredge material placement. The four potential DMPA options for the Channel Duplication Project as illustrated in Figure 1.1 are:

- East Banks Expansion
- West Banks Island reclamation
- Port Central Expansion reclamation
- Western Basin Expansion reclamation

The potential DMPAs are discussed separately within Sections 2, 3, 4 and 5. The number of samples proposed differs between options and, as such, the individual sampling programs are contained within the specific Section. Reporting and quality assurance and quality control (QA/QC) will be consistent for each of the placement options and will follow the same protocols and are discussed in Sections 6 and 7.

Port of Gladstone Channel Duplication

Figure 1.1: Dredge Area and Indicative Dredge Material Placement Options

1.3 Purpose of the Sediment Characterisation Plan

The primary purpose of this Sediment Characterisation Plan (SCP) is to establish ambient geochemical baseline conditions in terms of sediment character at the potential DMPAs, to an Environmental Impact Assessment (EIA) level, in order to provide sufficient information to achieve approval of the Gladstone Ports Corporation (GPC) Environmental Impact Statement (EIS) for Port of Gladstone Gatcombe and Golding Channel Duplication Project under the *Environment Protection and Biodiversity Conservation Act 1999* (EPBC Act) and the *State Development and Public Works Organisation Act 1971* (SDPWO Act).

Sediment characterisation at the DMPAs will be constrained to testing at various locations of the top 1 m of the site/s as there will be limited, if any, interaction between the dredge sediments and those found within the deeper layers of the DMPAs. Previous sediment sampling and analysis undertaken within the Port of Gladstone is presented in Figure 1.2.

This SCP outlines the proposed sampling program required to characterise the sediments within the DMPAs. The results of the sampling program will be used to determine the suitability of the area/s to receive dredge material from the Channel Duplication Project and to inform any application for a Sea Dumping Permit (if required) under the *Environment Protection (Sea Dumping) Act 1981* (Sea Dumping Act) or Operational Works (Tidal Works) under the *Sustainable Planning Act 2009*.

The SCP has been prepared by Aurecon Australasia Pty Ltd (Aurecon) on behalf of GPC with reference to the following guidelines:

- National Assessment Guidelines for Dredging 2009 (NAGD 2009)
- *National Environment Protection (Assessment of Site Contamination) Measure 1999* as amended in April 2013 (National Environment Protection Council 2013)
- Australian and New Zealand Water Quality Guidelines (ANZECC/ARMCANZ 2000a)
- Revision of the ANZECC/ARMCANZ Sediment Quality Guidelines, May 2013 (unpublished) (Simpson *et al* 2013)
- Monitoring and Sampling Manual (Environmental Protection (Water) Policy 2009) (DEHP 2010)

1.4 Sampling program methodology development

NAGD primarily focusses on the sampling and assessment of material proposed to be dredged. Section 4.3.1 (Site Assessment) of NAGD details qualitative assessment measures for sites where dredging and material placement are proposed to occur, and Appendix D of NAGD (Sampling Methods and Design of Sampling Programs) provides a detailed methodology for the design of sampling programs and calculation of sampling densities for dredge material. A methodology for the development of sampling programs and calculation of sampling densities for characterisation of sediment in dredge material placement sites is not provided in NAGD.

Although not specified in NAGD, the sediment sampling methodology contains appropriate procedures to partly adopt for the classification of sediment at a dredge material placement site, as it deals with the identification of potential contaminants in sediment. As a result, the design of this SCP and the proposed sampling program has been developed based upon the principles of 'design of sampling programs' found in NAGD (2009).

NAGD (2009) suggests that a power analysis be conducted on existing data to determine the number of samples required to adequately document the ambient baseline concentrations. However, there is limited data available on the potential DMPAs which precludes the undertaking of a power analysis.

Port of Gladstone Channel Duplication EIS - Sediment Characterisation Plan

Figure 1.2: Previous Sampling Locations within the Port of Gladstone

The number and location of samples collected in a sampling program is also dependent on the:

- Size of the area to be investigated
- Homogeneity of samples
- Precision of estimates required
- Funds available

> ANZECC Volume 2 Aquatic ecosystems, rationale and background information (2000b). Appendix 8, Collection and analysis of sediment samples.

The dispersion of potential chemical contaminants within individual DMPAs is expected to be relatively uniform as the individual DMPAs are generally under uniform hydrodynamic processes and therefore deposition rates.

A summary of the process used to calculate the sampling density for the DMPAs is provided below.

1. Use the NAGD calculation to determine the 'full' sampling requirement under NAGD (2009) using the DMPA investigation area. As NAGD sampling requirements are calculated using volumes to be disturbed, a depth of 1.0 m of sediment at each DMPA will be used for the calculation. The top 1.0 m of sediment is the maximum depth of DMPA sediment considered to have potential to interact with the dredged material from the Channel Duplication dredge area.

   The number of proposed sample locations in accordance with the NAGD (2009), where Table 6 of the NAGD (2009) will linearly extended with:

   $$y = 0.025x + 15.547$$

   where: y is the number of sampling stations; and
   x is the volume of dredge material (x 1,000 m^3).

2. Assess previous sediment sampling and analysis results to determine if the sediment at the DMPA could be classed as *'probably clean'* under NAGD (2009). If so, the number of sample locations can be halved.
3. Apply NAGD (2009) *'pilot study'* approach to determining contaminants likely to be found in dredge materials. The NAGD *'pilot study'* approach is recommended where insufficient current information on contaminant groups exists. It recommends approximately 20% of *'full'* sampling requirements be undertaken.

This level of sampling is considered to be of a sufficient scale and level of resolution to provide representative samples for an EIS level of assessment for informing the preferred dredge material placement options and to allow input into the Government approval process.

1.5 Dredging equipment and material placement methodology

The Channel Duplication dredging is expected to commence in late 2017 or later, with the commencement date being dependent on shipping demand from expansion of existing and new projects in Gladstone. The total duration of dredging is expected to be approximately 20 months with dredging equipment expected to operate 24 hours per day, 7 days per week.

Two dredging options are proposed and will be selected upon availability of dredging equipment and operations within the Port of Gladstone. The likely dredge volumes and timing of each dredging option is outlined in Table 1.1.

Table 1.1 Dredging options, location, volumes and timing

Stage	Location	Design depth (m LAT)	Timing (months)	Volume (Mm^3)*
Option 1				
1	Gatcombe and Golding Cutting	-13.5	12	7.25
2	Gatcombe and Golding Cutting	-16.1	8	5.34
Option 2				
-	Gatcombe and Golding Cutting	-16.1	20	12.59

Table note: *Includes 0.3 m (depth) allowance for potential over-dredging

The dredge methodology adopted will be subject to Maritime Safety Queensland's (MSQ) Regional Harbour Master acceptance of the successful dredge contractor's detailed execution plan. The dredge contractor will also need to comply with MSQ's Standard for Marine Construction Activities within Gladstone Harbour (Department of Transport and Main Roads 2012).

1.5.1 Differences between the DMPAs in dredging and placement method

Trailer suction hopper dredges (TSHDs) will be used as the preferred method of dredging the material for all DMPA options. Backhoe or grab dredgers and secondary barges may also be used where the water depth restricts access for the TSHDs.

For the East Banks DMPA Expansion, the dredge material will be loaded within the TSHD's internal hopper and the vessel will steam directly to the designated at sea placement location. Dredge material will be placed on the seabed within the East Banks DMPA Expansion from either the TSHD or barge via the opening of underkeel doors or valves as the vessel steams at low speed within the placement area.

Compared with alternate dredges, such as backhoe or grab dredges, TSHDs are preferred for offshore dredge material placement due to the higher efficiencies, lower costs and shorter dredging timeframes, provided there are no operational constraints (ie shallow water depths). GPC generally engages the TSHD Brisbane to carry out maintenance dredging within the Port of Gladstone, as sufficient depths are already established in areas to be maintained, and material is usually placed within the East Banks DMPA under existing approvals.

For the West Banks Island reclamation and Port Central Expansion reclamation options, the transportation of the dredge material is likely to require a combination of:

- Direct pumping from a cutter suction dredge (CSD) into a reclamation area
- Direct pumping from a TSHD hopper into a reclamation area
- Double handling of dredge material into a reclamation area (ie initial dredging using a TSHD, temporary sea floor placement near to the reclamation area and re-dredging using a CSD for placement in the reclamation area)

The final dredging option and dredge material transportation method/s for the reclamation options will be determined following the completion of the detailed geotechnical investigation for the Channel Duplication Project.

2 East Banks DMPA Expansion

2.1 Summary of placement area

The East Banks DMPA Expansion investigation area is located within Port limits and outside the Great Barrier Reef Marine Park (GBRMP) and extends from the boundary of the existing East Banks DMPA to the north, east and west (refer Figure 2.1). The East Banks DMPA Expansion investigation area has a footprint of 1,288 ha and an estimated capacity to receive dredge material of 65 Mm^3.

Should placement of dredge material be undertaken within the East Banks DMPA Expansion, a Sea Dumping Permit under the Sea Dumping Act will be obtained.

Table 2.1 provides a summary of the East Banks DMPA Expansion.

Table 2.1 Summary of East Banks DMPA Expansion

East Banks DMPA Expansion		
	**Placement type**	Offshore (at sea)
	Investigation area estimated capacity	65 Mm^3
	Investigation Area	1,288 ha
	Likely dredge equipment	TSHD for dredge area and placement
	Placement method	Material placed on sea floor through TSHD under-keel doors
	Establishment of placement site	No site establishment required
	Management of placement site	No ongoing operational management
	Notes	■ Site adjoins GPC's existing approved East Banks DMPA ■ Site located outside of the GBRMP

2.2 Summary of existing East Banks DMPA

Seal Rocks DMPA, located 1 km to the south-east of Wild Cattle Channel, received dredge material in 1975 from maintenance dredging of existing shipping channels. It was recognised in 1979 during preparation for capital dredging to accommodate 120,000 dead weight tonnage (dwt) (Cape size) vessels, that Seal Rocks would not have sufficient capacity for the dredge material and that an alternate placement site was required. The existing East Banks placement site was proposed and its suitability investigated (GPA 2002).

Port of Gladstone Channel Duplication EIS - Sediment Characterisation Plan

Figure 2.1: Previous Sampling within East Banks DMPA Expansion

The existing East Banks DMPA first received material during the 1980/1981 dredging program, following approval under Section 86 of the Queensland *Harbours Act 1955*. The existing East Banks DMPA is located to the north-east of the proposed Channel Duplication dredge footprint, within Port limits and the Great Barrier Reef World Heritage Area (GBRWHA) and outside the GBRMP. The existing East Banks DMPA has a footprint of approximately 1,050 ha and a remaining capacity of approximately 9 Mm^3 (BMT WBM 2012a), which has been allocated for maintenance dredge material placement. The existing East Banks DMPA has a depth that varies between approximately -9 m to -15.5 m (ie 9 m to 15.5 m below datum).

While alternative offshore (at sea) DMPAs were investigated, the existing East Banks DMPA was selected due to the following:

- It was within reasonable distance of the shipping channels
- It was sheltered from the strong currents of the South and East Channels
- It was protected by the naturally occurring East Banks that reduces current flow across the DMPA during ebb tides
- It was clear of the shipping transit and anchorage areas
- It was clear of the areas trawled by commercial fisheries

The initial approval for the site was obtained under the Queensland *Harbours Act 1955*. While the Sea Dumping Act and ANZECC Guidelines (2000a) were not in place at that time, a similar process was carried out.

Table 2.2 details the various dredging campaigns and the associated volumes of material placed at the existing East Banks DMPA.

Table 2.2 History of dredge material placement at the existing East Banks DMPA

Type of Dredging	Dates	Volume (m^3)
Maintenance	December 2013 – December 2014	350,000

2.3 Previous investigations

The first detailed study to characterise the existing East Banks DMPA was carried out in 1992 for a Sea Dumping Permit application for offshore dredge material placement. Several studies have since been carried out that further characterise the area. Table 2.3 outlines the previous investigations undertaken within and adjacent to the existing East Banks DMPA. Previous sediment sampling locations are presented in Figure 1.2 and Figure 2.1.

Table 2.3 Previous investigations within the East Banks DMPA

Report	Purpose	Sampling type	Timing of sampling

Report for Macrobenthic Sampling Pre and Post 2005 Maintenance Dredging (GHD 2006b)	Assess the impacts of offshore dredge material placement on benthic communities and sediment characteristics	■ Particle size distribution ■ Benthic macroinvertebrates	19 – 20 October 2005 21 – 22 November 2005
Contaminants in Port Curtis: Screening Level Risk Assessment, Cooperative Research Centre for Coastal Zone, Estuary and Waterway Management (Apte *et al.* 2005)	Collect data, identify data gaps and identify contaminants that pose a risk to humans and the environment	■ Water quality ■ Sediment contamination ■ Seagrass and marine biota contamination	August/October 2001 February 2002
Gladstone Harbour Channel – Sediment Analyses May 2000 (WBM Oceanics Australia 2000)	Assess sediment quality for maintenance dredging offshore material placement	■ Sediment contamination	26 May 2000
Gladstone Harbour - Channel Sediment Analyses September 1996 (WBM 1996)	Assess sediment quality for maintenance dredging offshore material placement	■ Sediment contamination	24 – 25 September 1996
Port of Gladstone Turbidity Measurement Study (WBM 1993)	Assess ambient turbidity levels surrounding reef communities of Facing Island	■ Water quality	7 – 23 March 1993
Environmental Studies of Proposed Channel Dredging (WBM 1992)	Assess baseline conditions of offshore material placement sites for maintenance dredging offshore material placement	■ Particle size distribution ■ Sediment contamination ■ Water quality, wave and current ■ Benthic macroinvertebrates	22 – 29 June 1992

Prior to the establishment of the existing East Banks DMPA, GPC (then called the Gladstone Port Authority) as part of the initial selection process, described the East Banks DMPA as a 'marine desert'. It is unclear whether this conclusion was based upon ecological surveys, however subsequent surveys since then (CQU 2003; 2005; GHD 2006b; BMT WBM 2007) have indicated that the area of the East Banks DMPA is predominantly a sandy sediment area that is depauperate in nature. Adjacent areas were also found to be limited in diversity although did have slightly higher mean species richness with higher abundances.

The marine ecology values and potential impacts within and adjoining the DMPA options will be addressed as part of the EIS.

2.4 Physical and chemical characteristics of sediments

As outlined in Section 2.3, there have been numerous investigations undertaken at the existing East Banks DMPA, largely related to the Port maintenance dredge deposition monitoring (and as such have comprised sediment and/or benthic ecological surveys). It is clear from the reports that the DMPA is dominated by sand fraction with relatively little fine sediments when combined with adjacent areas (BMT WBM 2007). BMT WBM (2009) demonstrated (through acoustic mapping of the seabed) that 88% of all acoustic records were comprised of medium to coarse sands (Class 1) with the remaining 12% being comprised of highly variable fine sand and silts (Class 2) with these records usually being located in the north and eastern corners of the DMPA. Ground truthing of the acoustic mapping indicated that a third type of substrate comprising of rubble and semi-exposed reef habitat (Class 3) was also present and more typically identified in the acoustic mapping of the Class 2 sediments (although also found in the Class 1 sediments).

The BMT WBM (2009) study also examined the presence of marine habitats and species during the ground truthing exercise. The Class 3 rubble did occasionally have associated epibenthic flora and fauna but in other locations was bare. Soft sediment associated epifauna was very sparse and most of the DMPA showed limited levels of bio-turbation (ie holes, burrows etc.). The exception to this was one site in the south eastern corner of the DMPA which had high levels of bio-turbation as well as extensive micro-topographical variation due to ripple formation.

A review of the studies relevant to the East Banks DMPA Expansion area indicate that sediments within this area can be considered '*probably clean'*, under the NAGD (2009) sediment quality guidelines with most trace metals below the screening levels and all other contaminants below the level of detection.

Four separate studies (BMT WBM 2009; DERM 2011; DEHP 2012; BMT WBM 2012a) have reported exceedances at or adjacent to the site in relation to arsenic where a single sample per study exceeded the NAGD Screening Level of 20 mg/kg (with values of 21 mg/kg, 42 mg/kg, 24 mg/kg and 22 mg/kg, respectively). It should be noted however, that no exceedances over the NAGD Trigger Value were recorded and that two of the samples were located outside of the dredge material placement zone of influence. Elevated levels of arsenic have also been previously identified within the Port Curtis area and studies by the Cooperative Research Centre (CRC) for Coastal Zone, Estuary and Waterway Management undertook a screening level risk assessment of contaminants in sediments within Port (Apte *et al.* 2005). The CRC research concluded that elevated levels of arsenic in Port Curtis were the result of natural local geology rather than metal contamination from anthropogenic sources.

Sediment investigations conducted by the Department of Environment and Heritage Protection (DEHP) collected two sediment samples in 2011 and followed up one of the sample locations in 2012. Results from these investigations found that manganese exceeded the Draft Guidelines for the Assessment and Management of Contaminated Land in Queensland (EPA 1998) during both years (DERM 2011; DEHP 2012). Manganese, as with arsenic, has been recorded previously at varying sediment depths and water quality samples within Port Curtis (Vision Environment 2009) and historical records (and a mining history at Auckland Point and Boat Creek) clearly demonstrate it is naturally occurring, although how much the historic mining of manganese has contributed to the elevated levels within the Port Curtis area is unknown. Manganese however is generally considered to have a low level of toxicity to marine biota (Anastasi and Wilson 2010) and currently has no trigger level within the NAGD (2009), although the draft Queensland contaminated land guidelines (EPA 1998) use the value of 500 mg/kg.

2.5 Sampling locations calculation

The East Banks DMPA Expansion investigation footprint (excluding the existing East Banks DMPA) is 1,288 ha. The volume of DMPA sediment considered to have potential for interaction with the dredged material and to be assessed as part of this SCP is 12.88 Mm^3.

Previous investigations have found sediment at the existing East Banks DMPA to be compliant with NAGD (2009) (BMT WBM 2012a; GHD 2006a). It is considered that the sediments can be categorised as '*probably clean'* under NAGD (2009) and, as such, the number of samples required for this SCP can be halved.

Table 2.4 provides a summary of the inputs to calculate the number of sampling locations to be sampled. The methodology used to calculate the number of sample locations is provided in Section 1.4.

Table 2.4 Summary of proposed sampling locations for East Banks DMPA Expansion

Site	Volume of sediment likely to interact (m^3)	Full number of sample locations required under NAGD (2009)	Number of sample locations as sediments are classed as 'probably clean'	Number of sample locations for SCP
East Banks DMPA Expansion (excluding existing East Banks)	12.88 million	338	169	34

An additional two samples (EB35 and EB36) will be collected at reference points beyond the boundary of the East Banks DMPA Expansion, to the north-east and south-west. In addition, the data previously collected from the two existing reference sites for the GPC maintenance dredging will be used to inform the background levels of sediment contamination in Port Curtis (BMT WBM 2012a; GHD 2006a).

The sampling locations have been randomly allocated in accordance with the method outlined in NAGD (2009). A square grid was lain over the East Banks DMPA Expansion with at least five times the number of grid squares as there is sampling locations (ie 170 grids squares) (refer Figure 2.2). The 34 sample locations were randomly allocated between the grid squares using ArcGIS 10.1 Advanced – Great Random Points Tool.

The sampling locations are displayed in Figure 2.2 and listed in Table 2.5. Samples will be collected at the centre of each grid square with the actual sampling to be taken as close as possible to the GPS coordinates generated.

3 West Banks Island reclamation

3.1 Summary of placement area

The West Banks Island reclamation DMPA is located between Boyne Island and the Gatcombe Channel, to the south of the existing shipping channel. It is south-east of the South Trees Wharves and Boyne Wharf (refer Figure 3.1). The West Banks Island reclamation is situated on a known sand bank, with some areas exposed during low tide. Depths within the West Banks Island reclamation range from 0 to -5 m.

Table 3.1 provides a summary of the West Banks Island reclamation.

Table 3.1 Summary of West Banks Island reclamation

West Banks Island reclamation		
	**Placement type**	Island reclamation
	Investigation area estimated capacity	27-30 Mm^3
	Investigation area	468 ha
	Beneficial use/end land use	Port land with potential for development of 16 wharves
	Likely dredge equipment	TSHD and CSD for dredge area
	Placement method	■ Small portion of Golding Channel and most of Gatcombe Channel can be dredged by CSD and material directly pumped into reclamation area with assistance of boosters ■ Material unlikely to be pumped directly from a TSHD, rehandling with a CSD would be required for some material
	Establishment of placement site	■ Bund wall construction on marine and sub-tidal area of varying depths ■ Bund material would be required to be sourced from a mainland quarry, trucked and/or barged or causeway/bridge constructed to the site
	Management of placement site	■ Dewatering of dredge decant water ■ Material settlement 2-3 years

3.2 Previous investigations

A review of previous sediment data from the Port Curtis area has indicated that although Gladstone is an urban and industrial area, results show relatively few incidences of sediments with elevated metal results. A review of the previous sediment investigation works undertaken for GPC indicate that approximately the top 0.3 m of sediment within Port Curtis is likely to be post 1950s with this sediment band being the most likely (if any) to contain contaminants from anthropogenic inputs. This is in agreement with Vicente-Beckett *et al.* (2006) who demonstrated that anthropogenic influenced sediments are likely to only occur in the top 0.28 m. Elevated levels of metals, if detected below this depth, are likely to be naturally occurring and related to geology within the area.

No previous sediment investigations have been conducted within the West Banks Island reclamation footprint, however, given the proximity to the existing shipping channels sediment results from sampling for maintenance dredging are likely to provide good indication of the *in situ* contamination status of the sediments for the West Banks Island reclamation footprint.

A number of investigations have collected samples adjacent to the West Banks Island reclamation. GHD for Central Queensland Port Authority (CQPA) (2006) collected two samples to the north-east of the site along the existing Gatcombe Channel (S17/3 and S18/1 on Figure 3.1) as part of a larger channel investigation in which no exceedances of the National Ocean Disposal Guidelines for Dredged Material (NODGDM) (2002) Screening Levels were recorded.

DEHP conducted a sediment study in 2012 in which two samples (STISM –South Trees Inlet South Mouth and SFI – South Facing Island) (refer Figure 1.2) were collected from the sea bed directly north-west and north of the West Banks Island reclamation footprint, respectively. Neither sample exceeded the NAGD (2009) Screening Levels for any contaminants.

BMT WBM (2012a) (for GPC) collected ten sediment samples along the existing Gatcombe Channel (S17 to S26) to inform maintenance dredging in 2012. Again, no samples exceeded the NAGD (2009) Screening Levels for any contaminants.

3.3 Geology and physical characteristics

The stratigraphy of the West Banks Island reclamation is likely to comprise the following:

- Young (Holocene) Alluvium (marine sediments)
- Underlain by old (Pleistocene) Alluvium
- Underlain by bedrock of the Wandilla Formation

Previous works have shown that the Port Curtis area usually demonstrates young alluvium comprising of a thin layer of Holocene aged estuarine clay and recently deposited marine sediments, with a thickness from 0.5 m to approximately 5 m in un-dredged areas, and is described as soft clay and loose sand/gravel with shell fragments.

The young alluvium is typically underlain by residual clays of older alluvium, comprising sandy clay, clayey sand, gravelly sand and clay. The gravel and sand are typically intersected in discrete pockets up to 1 m thick. This is underlain by extremely weathered bedrock of the Wandilla Formation.

Dominant substrate at all depths is usually sand and then clay; however deeper samples taken during the Western Basin Dredging and Disposal Project EIS sampling found higher proportions of gravels with the finer sediments being located generally within the top 0.5 m with gravel or sand layers likely to be located in the top 10 m of sediment.

The West Banks Island reclamation is situated on a known sand bank, with some areas exposed during low tide. Depths within the West Banks Island reclamation range from 0 to -5 m AHD. Surface sediments within the Gatcombe Channel (within the vicinity of the West Banks Island reclamation) are predominately coarse in nature with a combined gravel and sand proportion greater than 90% (BMT WBM 2012a). Very coarse surface sediments containing gravel and shell material were also present, with gravel content exceeding 30% with a maximum of 80% gravel (BMT WBM 2012a).

3.4 Sampling locations calculation

The West Banks Island reclamation investigation footprint is 468 ha. The volume of DMPA sediment considered to have potential for interaction with the dredged material and to be assessed as part of this SCP is 4.68 Mm^3.

Table 3.3 provides a summary of the inputs to calculate the number of sample locations to be sampled. The methodology used to calculate the number of sample locations is provided in Section 1.4.

Table 3.3 Summary of proposed sampling locations for West Banks Island reclamation

Site	Volume of sediment likely to interact (m^3)	Full number of sample locations required under NAGD (2009)	Number of sample locations as sediments are classed as 'probably clean'	Number of sample locations for SCP
West Banks Island reclamation	4.68 million	132	-	27

The sampling locations have been randomly allocated in accordance with the method outlined in NAGD (2009). A square grid was lain over the West Banks Island reclamation area with at least five times the number of grid squares as there is sampling locations (ie 135 grid squares) (refer Figure 3.2). The 27 samples were randomly allocated between the grid squares using ArcGIS 10.1 Advanced – Great Random Points Tool.

The sampling locations are displayed in Figure 3.2 and listed in Table 3.4. Samples will be collected at the centre of each grid square with the actual sampling to be taken as close as possible to the GPS coordinates generated.

4 Port Central Expansion reclamation

4.1 Summary of placement area

The Port Central Expansion reclamation DMPA is located to the south of the existing Barney Point Wharf and Coal Terminal, the Barney Point residential area of Gladstone and north of QAL located at Parsons Point. It is to the south of the existing Auckland Channel north of South Trees Wharves (refer Figure 4.1). Table 4.1 provides a summary of the Port Central Expansion reclamation DMPA.

Table 4.1 Port Central Expansion reclamation DMPA summary

Port Central Expansion reclamation		
 	**Placement type**	Land based and intertidal reclamation, and capping for QAL activities
	Investigation area estimated capacity	25-30 Mm^3
	Investigation Area	Total area: 276 ha Subtidal area: 30.28 ha
	Beneficial use/end land use	Port land/community use/habitat creation Potential to rehabilitate areas adjacent to QAL
	Likely dredge equipment	TSHD for dredge area
	Placement method	Material unlikely to be pumped directly from a TSHD, rehandling with a CSD would be required
	Establishment of placement site	■ Bund wall construction within intertidal and sub-tidal area to varying depths ■ Greater bund wall volumes required relative to solely intertidal or land based areas ■ Bund material to be imported to site from local quarry
	Management of placement site	■ Dewatering of dredge decant water ■ Material settlement 2-3 years

4.2 Previous investigations

As discussed for the previous DMPA options, previous results of surveys in Port Curtis have shown relatively few incidences of sediments showing elevated contamination (Apte *et al.* 2005, GHD 2006a, BMT WBM 2007, DERM 2011; DEHP 2012; BMT WBM 2012a; refer Table 2.3 for a full list of previous investigations). Previous investigation locations are presented in Figure 1.2 and Figure 4.1.

No previous sediment investigations have been conducted within the marine footprint (below LAT) of the Port Central Expansion site. However, given the proximity of the site to the existing shipping channels, sediment results from sampling for maintenance dredging are likely to give an indication as to the sediment status at the site.

GHD (2006a) collected two sediment samples along the existing Auckland Channel (S21/6 to the north-east and S22/5 to the north of Port Central Expansion reclamation) for maintenance dredging in 2006. One sample (S22/5) exceeded the NODGDM (2002) Screening Levels for two polycyclic aromatic hydrocarbons (PAHs), acenaphthene and fluorene (GHD 2006a).

More recent sediment investigations were conducted by DEHP in 2012 in close to proximity to the Port Central Expansion reclamation and these results are likely to be comparable to the site itself. The results from the two sites (STINM – Northern Mouth of South Trees Inlet and NGPSW3 – North of GPCSW3 discharge point) did not exceed the NAGD (2009) Screening Levels for any contaminants.

BMT WBM (2012a) (for GPC) collected three sediment samples along the existing Auckland Channel (S30 to S32) for maintenance dredging in 2012. The samples did not exceed the NAGD (2009) Screening Levels for any contaminants.

4.3 Geology and physical characteristics

The stratigraphy of the Port Central Expansion reclamation is likely to comprise the following:

- Young (Holocene) Alluvium (marine sediments)
- Underlain by old (Pleistocene) Alluvium
- Underlain by bedrock of the Wandilla Formation

Previous works have shown that the Port Curtis area usually demonstrates young alluvium comprising of a thin layer of Holocene aged estuarine clay and recently deposited marine sediments, with a

thickness from 0.5 m to approximately 5 m in un-dredged areas, and is described as soft clay and loose sand/gravel with shell fragments.

The young alluvium is typically underlain by residual clays of older alluvium, comprising sandy clay, clayey sand, gravelly sand and clay. The gravel and sand are typically intersected in discrete pockets up to 1 m thick. This is underlain by extremely weathered bedrock of the Wandilla Formation.

Dominant substrate at all depths is usually sand and then clay; however deeper samples taken during the Western Basin Dredging and Disposal Project EIS sampling found higher proportions of gravels with the finer sediments being located generally within the top 0.5 m with gravel or sand layers likely to be located in the top 10 m of sediment.

The marine area of the Port Central Expansion reclamation is situated north of QAL, between the mainland and the Auckland Channel. The depth of the marine area within Port Central Expansion reclamation ranges from 0 to -10 m AHD. Surface sediments within the Auckland Channel (within the vicinity of the Port Central Expansion reclamation) are predominately coarse in nature with a combined gravel and sand proportion greater than 90% (BMT WBM 2012a). Very coarse surface sediments containing gravel and shell material were also present, with gravel content exceeding 40% with a maximum of 75% gravel (BMT WBM 2012a).

4.4 Sampling locations calculation

During the tender phase for the project, only the subtidal footprint (ie the area below Lowest Astronomical Tide (LAT)) of the Port Central Expansion reclamation investigation footprint (30.28 ha) was included. Whilst the investigation was underway, it was determined that the intertidal area (LAT to Highest Astronomical Tide (HAT)) (39.76 ha) could also be investigated during this phase.

The volume of DMPA sediment considered to have potential for interaction with the dredged material and to be assessed as part of this SCP is 302,800 m^3 for the subtidal area and 397,600 m^3 for the LAT to HAT area (700,400 m^3 in total).

The sediment and soils within the area above HAT, ie the terrestrial portions of the site, will be assessed by a separate investigation.

Table 4.3 provides a summary of the inputs to calculate the number of sample locations to be sampled. The methodology used to calculate the number of sample locations is provided in Section 1.4.

Table 4.3 Summary of proposed sampling program for Port Central Expansion reclamation

Site	Volume of sediment likely to interact (m^3)	Full number of sample locations required under NAGD (2009)	Number of sample locations as sediments are classed as 'probably clean'	Number of sample locations for SCP
Port Central Expansion reclamation (subtidal)	302,800	23	-	5
Port Central Expansion reclamation (LAT to HAT)	397,600	26	-	6
Port Central Expansion reclamation Total (below HAT)	700,400	49	-	11

The sampling locations have been randomly allocated in accordance with the method outlined in NAGD (2009). A square grid was lain over the Port Central Expansion reclamation subtidal area with at least five times the number of grid squares as there is sampling locations (ie 25 grids squares for the subtidal region and 30 for LAT to HAT) (refer Figure 4.2). The five samples were randomly allocated between the grid squares using ArcGIS 10.1 Advanced – Great Random Points Tool.

The sampling locations are displayed in Figure 4.2 and listed in Table 4.4. Samples will be collected at the centre of each grid square with the actual sampling to be taken as close as possible to the GPS coordinates generated.

Table 4.4 Location of sediment sample sites

5 Western Basin Expansion reclamation

5.1 Summary of placement area

The Western Basin Expansion reclamation is located to the north of the existing Western Basin reclamation and south of the Narrows (refer Figure 5.1). Table 5.1 provides a summary of the Western Basin reclamation DMPA.

Table 5.1 Western Basin Expansion reclamation DMPA summary

Western Basin Expansion reclamation		
 Highest Astronomical Tide Lowest Astronomical Tide Dredge Material Placement Options (Indicative Location)	**Placement type**	Intertidal reclamation
	Estimated capacity	20 Mm^3
	Estimated Area	342.075 ha
	Beneficial use/end land use	Port land with potential for the development of 4 wharves
	Dredge equipment	TSHD for dredge area
	Placement method	Material unlikely to be pumped directly from a TSHD, rehandling with a CSD would be required
	Establishment of placement site	■ Bund wall construction within intertidal and sub-tidal area to varying depths ■ Bund material to be imported to site from quarry via trucks
	Management of placement site	■ Dewatering of dredge decant water ■ Material settlement 2-3 years

5.2 Previous investigations

As discussed for the previous DMPA options, previous results of surveys in Port Curtis have shown relatively few incidences of sediments showing elevated contamination (Apte *et al.* 2005, GHD 2006a, BMT WBM 2007, DERM 2011; DEHP 2012; BMT WBM 2012a; refer Table 2.3 for a full list of previous investigations). Previous investigation locations are presented in Figure 1.2 and Figure 4.1.

In 2012 CSIRO (Angel et al) collected sediment samples from within the existing Western Basin reclamation (prior to construction), Site 7 (4 m), and Site 4 (4 m) and Site 8 (4.5 m) in nearby areas. Total metal concentrations in the sediments were below the NAGD (2009) Screening Levels

Apte et al. 2005 collected three sediment samples within the Fishermans Landing Northern Expansion area and existing Western Basin reclamation. Sample '1-7' did not exceed the NAGD (2009)

Figure 5.1: Previous Sampling Locations within Western Basin Expansion reclamation

Screening Levels for any contaminants. Arsenic concentrations in Sample '2-7' (21 mg/kg) exceeded the NAGD (2009) Screening Levels (20 mg/kg). Nickel concentrations in Sample '2-6' (25 mg/kg) and Sample '2-7' (28 mg/kg) also exceeded the NAGD (2009) Screening Levels (21 mg/kg).

DEHP 2012 collected two sediment samples (BW1 and BW2) on the seaward side of the existing Fishermans Landing Northern Expansion. Neither sample exceeded the NAGD (2009) Screening Levels.

5.3 Geology and physical characteristics

The stratigraphy of the Western Basin Expansion reclamation is likely to comprise the following:

- Quaternary-recent sediment (unconsolidated marine sediments – silt, clay, sand)
- Underlain by the Tertiary Narrows Beds:
  - Curlew Formation (claystone, carbonaceous shale, lignite)
  - Underlain by Rundle Formation (oil shale, claystone)
  - Underlain by Worthing Formation (sandstone, siltstone, claystone, conglomerate)
- Underlain by the Devonian-Carboniferous Curtis Island Group, Doonside Formation.

Previous works have shown that the Port Curtis area usually demonstrates young alluvium comprising of a thin layer of Holocene aged estuarine clay and recently deposited marine sediments, with a thickness from 0.5 m to approximately 5 m in un-dredged areas, and is described as soft clay and loose sand/gravel with shell fragments.

The young alluvium is typically underlain by residual clays of older alluvium, comprising sandy clay, clayey sand, gravelly sand and clay. The gravel and sand are typically intersected in discrete pockets up to 1 m thick. This is underlain by extremely weathered bedrock of the Wandilla Formation.

Dominant substrate at all depths is usually sand and then clay; however deeper samples taken during the Western Basin Dredging and Disposal Project EIS sampling found higher proportions of gravels with the finer sediments being located generally within the top 0.5 m with gravel or sand layers likely to be located in the top 10 m of sediment.

The Western Basin Expansion reclamation area contains estuarine clay ranging in thickness from 0.5 m to 5.0 m. The underlying soil is comprised of clay, silty clay or residual clay. Some areas have been identified as containing gravel and/or sand layers, most likely in the top 1om of sediment. (GHD 2009)

5.4 Sampling locations calculation

The Western Basin Expansion reclamation investigation area is 342.08 ha. The volume of DMPA investigation area sediment considered to have potential for interaction with the dredged material and to be assessed as part of this SCP is 3,420,750 m^3.

Table 5.2 provides a summary of the inputs to calculate the number of sample locations to be sampled. The methodology used to calculate the number of sample locations is provided in Section 1.4.

Table 5.2 Summary of proposed sampling program for Western Basin Expansion reclamation

Site	Volume of sediment likely to interact (m^3)	Full number of sample locations required under NAGD (2009)	Number of sample locations as sediments are classed as 'probably clean'	Number of sample locations for SCP
Western Basin Expansion reclamation	3,420,750	101	-	21

The sampling locations have been randomly allocated in accordance with the method outlined in NAGD (2009). A square grid was lain over the Western Basin Expansion reclamation area with at least five times the number of grid squares as there is sampling locations (ie 105 grids squares) (refer Figure 5.2). The 21 samples were randomly allocated between the grid squares using ArcGIS 10.1 Advanced – Great Random Points Tool.

The sampling locations are displayed in Figure 5.2 and listed in Table 5.3. Samples will be collected at the centre of each grid square with the actual sampling to be taken as close as possible to the GPS coordinates generated.

Port of Gladstone Channel Duplication

Figure 5.2: Western Basin Expansion Expansion reclamation - Proposed Sampling Program

6 Sampling and Analysis

6.1 Introduction

6.1.1 Sampling objective

The objective of the proposed sampling program is to characterise the sediments of the three dredge material placement areas to determine their suitability to receive dredge material from the Channel Duplication Project.

Information on the physical and chemical characteristics of the sediments is required to investigate the ambient baseline condition within the DMPA site options and their surroundings. As such, this SCP has been prepared to meet the requirements outlined in the NAGD (2009) for the assessment of the DMPAs and their suitability for receiving dredge material from the Channel Duplication Project.

6.1.2 Responsible parties

GPC is the proponent for the proposed Gatcombe and Golding Cutting Channel Duplication Project at the Port of Gladstone. GPC has engaged Aurecon for the preparation of this Combined SCP for the dredge material placement options and provision of the results of the sediment sampling as supporting information for the EIS for the Channel Duplication Project, and other environmental applications.

A laboratory holding National Association of Testing Authorities (NATA) certification for the required analyses will be contracted to undertake chemical analysis of the samples.

6.1.3 Occupational health and safety

Sediment sampling will be undertaken in reference to a suitable occupational health and safety plan. This includes sample collection, processing and handling, and will be supplemented by health and safety documentation from the vessel contractor. This is to ensure the safety, health and welfare for personnel for all work performed within the contracted work-scope, and that the safety, health and welfare of others, including the public and the natural environment are not affected by that work. In particular, the occupational health and safety plan will address safety in relation to working over water and addressing potential adverse weather conditions.

Given the majority of sediment to be collected is *probably clean*, risk to human health from hazardous materials is not anticipated. However, appropriate sample collection, processing and handling techniques will be developed as part of an occupational health and safety plan and will be implemented during sediment sampling.

6.1.4 Personnel and vessel requirements

The vessel from which sampling is undertaken will have an appropriate sample processing area, free from debris and residue and removed from motors and exhaust, to minimise the potential for sample contamination. The sample processing area will be washed down prior to use.

Two appropriately qualified and experienced environmental scientists (or equivalent) will be on board the vessel to direct, log and provide records of sampling, take photographs, process and package samples in accordance with NAGD (2009) and make sure they are delivered to the analytical laboratory within the required holding times.

6.1.5 Contingency planning

The Contractor and associated vessel employed to undertake sampling will be required to have contingency plans in place for adverse weather conditions and/or equipment malfunction to prevent any impacts on the timing of the field program.

The Contractor and field staff will also make themselves aware of environmental conditions that may affect sampling, including the depth of water (which is variable across the areas to be sampled), tidal currents and onshore winds.

6.1.6 Review of the SCP

This SCP has been prepared by Aurecon, on behalf of GPC, to comply with NAGD (2009) and, where NAGD (2009) is not applicable, the ANZECC Guidelines (2000a) or draft Queensland Contaminated Land Guidelines (EPA 1998). The results from the SCP will provide supporting information for the EIS and subsequent permit applications required to undertake capital dredging.

The results of the sampling and analysis will be presented within a DMPA Options Sediment Characterisation Implementation Report for the three potential sites as supporting information for the EIS and any subsequent permit applications, with a copy of the final SCP as an appendix.

6.2 Sampling methodology

6.2.1 Design of sampling program

The details of the samples required within each potential site are contained within the relevant site section (refer Sections 2.5, 3.4 and 4.4). Table 6.1 outlines the number of samples required within each of the dredge material placement options.

Table 6.1 Summary of proposed sampling program

Site	Volume of sediment likely to interact (m^3)	Full number of samples required under NAGD	Number of samples if sediments are classed as 'probably clean'	Number of samples for SCP
East Banks DMPA Expansion (excluding existing East Banks)	12.88 million	338	169	34
West Banks Island reclamation	4.68 million	132	-	27
Port Central Expansion reclamation (total below HAT)	700,400	49	-	11
Western Basin Expansion reclamation	3.42 million	101	-	21

6.2.2 Depth of sampling and collection method

In the field, GPS coordinates of each sampling site will be recorded and sites plotted on a map of appropriate scale. Differential GPS will be used, giving an accuracy of not less than +/- 10 m.

NAGD (2009) requires only an assessment of the surface sediments as the dredged material will not mix with deeper sediments.

At each sampling location, core samples will be taken to a depth of 1 m, where possible. If core samples are unable to be taken, for reasons such as water depth, diver safety and/or coring refusal, grab samples will be taken to ensure sediment (and data) is collected from that sampling location. Grab samples of surface sediment will be collected and mixed in a stainless steel bucket, using a stainless steel spoon to make a homogeneous mix. Based upon previous investigations, it is expected that up to five grabs will be required to provide sufficient material, however more grabs will be taken if required to collect sufficient sample volume to allow for the required laboratory analysis requirements.

Where core samples are taken, discrete samples will be taken from the core at depths of 0.0-0.5m and 0.5-1.0 m for laboratory analysis. Sufficient core samples will be taken at each sampling location to meet required sample volumes (refer Section 5.2.3).

All samples will be placed within pre-washed and labelled glass jars for laboratory analysis.

6.2.3 Sample volume and containers

The volume of sediment collected for each sample must be adequate to conduct all required chemical and physical analyses. Based on Table 5 of the NAGD (2009), it is anticipated that 250 mL of sediment per sample/replicate for chemical analysis and 500 mL for particle size will be adequate for the basic Phase II suite.

Samples will be placed in laboratory supplied glass jars with Teflon-lined lids or zip-lock bags as required by the laboratory. Jars will be completely filled with sample. Sample volume and container requirements will be confirmed with the laboratory prior to sample collection.

6.2.4 Field measurements

The following field measurements will be recorded on an appropriate field data sheet:

- Date and time of sampling
- Person conducting sampling, client, project, sample location identifier, GPS coordinates of actual sampling location
- Field logs – details recorded will include depth, physical appearance (eg sand, clay), colour, odour, plasticity, number of grabs required, sand grain size and presence of organic matter, marine organisms, coal particles, shell layers and other relevant features
- Water quality – each sample will be logged with reference to the ANZECC Guideline (2000a) and visual observations such as turbidity (by eye), odour, colour etc will be recorded as well as in situ instrument readings, including temperature, dissolved oxygen, electrical conductivity and pH
- Photographs – digital photographs (minimum resolution of 12 megapixels) will be taken of each sediment grab and sampling equipment/methodology
- Tides – the tide chart for each day of sampling will be included in the report and water depth at the time of sampling recorded. Observations such as falling/rising tides will also be recorded
- Weather – weather conditions including wind speed, sea state, currents and rainfall for each day of sampling will be recorded

6.2.5 Analysis of sediment samples

6.2.5.1 Geochemical

All samples will be analysed for the following analytes:

- Total recoverable hydrocarbons (TRH)

- Metals and metalloids (ie Sb, As, Cd, Cr, Cu, Pb, Hg, Mn, Ni, Ag and Zn)
- Nutrients (ammonia, nitrate, nitrite, total nitrogen and total phosphorus)
- Dioxins (analysed within 10 randomly selected samples from the assumed anthropogenic sediment layer – ie 0-0.5 m – six from East Banks Expansion, two from West Banks Island reclamation and two from Port Central Expansion reclamation)
- Organochlorine pesticides (OCP)
- Organophosphate pesticides (OPP)
- Polychlorinated biphenyl (PCB)
- Organometallics (monobutyltin, dibutyltin and tributyltin)
- Polycyclic aromatic hydrocarbons (PAHs)
- Total organic carbon (TOC)
- Benzene, toluene, ethylbenzene and xylenes (BTEX)

Table 6.2 contains further information regarding the analytes to be investigated.

6.2.5.2 Physical characteristics

Settling rates and particle sizes (sieve and hydrometer) will be analysed on selected samples that are representative of the sediment types and layers that are identified.

6.3 Sediment analysis

6.3.1 Data assessment

Results of chemical testing will be assessed for compliance to the Screening Levels specified in Table 2 of NAGD (2009) and the revised sediment quality values as provided in Simpson *et al.* (2013) (unpublished). Concentrations of organic contaminants, including organometallics and PAHs, will be adjusted to 1.0% TOC before being compared to Screening Levels. Statistical analyses of the data will include the calculation of 95% UCL of the mean as specified in the NAGD (2009). Where no NAGD Screening Level exists (eg manganese) the levels outlined in the Draft Queensland Contaminated Land Guidelines (EPA 1998) will be utilised.

The analysis data will be checked and validated with unusual results rechecked by the laboratory within the holding times.

Table 6.2 outlines the Screening Levels and the High Levels for the analytes to be investigated.

Table 6.2 Contaminant screening and high levels for sediment

Chemical	Units	NAGD (2009) Practical Quantification Limits (PQL)	NAGD (2009) Screening Level[1]	NAGD (2009) High Level[1]	Draft Queensland Contaminated Land Guidelines (EPA 1998)

Table notes: [1] Values provided in brackets represent revised sediment quality values as provided in Simpson *et al.* (2013) (unpublished).
[2] For comparison to revised sediment quality values (Simpson *et al.* 2013), concentrations will be normalised to 1.0% TOC

6.3.2 Further analysis

The results from the sampling program will be compared against the Screening Levels outlined in Table 6.2. If any of the samples contain contaminant concentrations above these Screening Levels, consultation will be undertaken with DoE and DEHP and, if required, the data will inform a power analysis, which will be used to determine the number of samples required to adequately characterise the ambient baseline concentrations at the three DMPA options.

6.4 Quality control and quality assurance procedures

6.4.1 Data quality objectives

Data Quality Objectives (DQOs) are qualitative and quantitative statements derived from the outputs of the first six steps of the seven steps DQO process that:

- Clarify the study objective
- Define the most appropriate type of data to collect
- Determine the most appropriate conditions from which to collect data
- Specify tolerable limits on decision errors which will be used as the basis for establishing the quantity and quality of data needed to support the decision

The DQO process (AS4482.1-2005) follows a systematic approach for defining the criteria that a data collection design should satisfy, including the number of samples and when, where and how to collect these samples. DQOs are employed to develop a scientific and resource-effective data collection design to assure decision makers that the type, quantity and quality of environmental data are appropriate for the intended application. In addition, decision makers will guard against committing sources to data collection efforts that do not support defensible decisions.

DQOs have been developed to define the type and quality of data required to achieve the objectives stated in Section 6.1.1. The DQOs were selected with reference to relevant guidelines published by the NAGD (2009) and the ANZECC Guidelines (2000a), which define the minimum data requirements and quality control procedures.

These matters are addressed in the seven step DQO approach presented in Table 6.3.

Table 6.3 Data quality objectives

Process	Response
Step 1: State the Problem	The ambient baseline condition of the sediments at East Banks DMPA Expansion site; the West Banks Island reclamation and the Port Central Expansion reclamation are required to be assessed in accordance with the requirements outlined in the NAGD (2009)
Step 2: Identify the Decision	The principle objective of the proposed sampling program is to characterise the sediments of the DMPA sites to determine their suitability to receive dredge material from the Channel Duplication Project
Step 3: Identify the Inputs to the Decision	■ Footprint of DMPA sites ■ Previous investigations within the DMPA sites ■ History of offshore dredge material placement within the Port of Gladstone
Step 4: Define the Boundaries of the Study	The boundaries of the three potential DMPAs are illustrated within Figures 2.1, 3.1 and 4.1

Process	Response
Step 5: Develop a Decision Rule	The assessment program has been designed to characterise the DMPA sites using the following criteria: ■ NAGD (2009) Screening Levels ■ NAGD (2009) High Values ■ Revision of the ANZECC/ARMCANZ Sediment Quality Guidelines, May 2013 (unpublished) (Simpson *et al* 2013) ■ Draft Queensland Contaminated Land Guidelines (EPA 1998) where NAGD Screening Levels are not available
Step 6: Specify Tolerable Limits on Decision Errors	The Data Quality Indicators (DQIs) have been established to set acceptance limits on field and laboratory data collected during the investigation (refer Section 5.4.2)
Step 7: Optimise the Design for Obtaining Data	This sampling methodology was developed in accordance with the NAGD (2009). Nominated samples judged as being representative of sediment values will be submitted for analysis as described in Section 6.3.1. Samples are to be analysed by a NATA Accredited Laboratory within approved sample withholding times

6.4.2 Data quality indicators

The DQIs for the assessment are presented in Table 6.4.

Table 6.4 Data quality indicators

DQI	Field	Laboratory	Acceptability limits
Completeness	■ Sediment proposed to be dredged pose a potential risk to health, safety and the environment and require investigation to characterise and assess the suitability for placement ■ Appropriate sampling procedures to be used ■ Experienced field team to undertake sampling ■ Correct documentation to be completed	■ All required samples analysed ■ Appropriate methods ■ Appropriate Limits of Reporting (LORs) ■ Appropriate Practical Quantitation Limits (PQLs) ■ Sample documentation correct ■ Sample holding times in compliance	As per NAGD 2009
Comparability	■ Correct sample procedures used at each location ■ Experienced field team ■ Same type (medium, volume and sampling technique) of samples collected	■ Same analytical methods used ■ Appropriate LORs ■ Samples submitted to the same NATA accredited laboratory ■ Analytical data is presented in the same unit	As per NAGD 2009
Representativeness	■ Appropriate media sampled ■ All media identified (ie sediment)	■ All required samples analysed	As per NAGD 2009

DQI	Field	Laboratory	Acceptability limits
Precision	■ Correct sample procedures used at each location ■ Collection of appropriate QA/QC samples	Analysis of: ■ Duplicate samples ■ Laboratory duplicate samples	Relative percent deviation (RPD) of 30-50%
Accuracy	■ Sampling procedures appropriate and complied with ■ Collection of appropriate QA/QC samples	Analysis of: ■ Method blanks ■ Laboratory surrogate spikes ■ Laboratory control samples ■ Reference material	■ Non-detect for contaminants of concern ■ 70-130%

6.4.3 Decontamination

Prior to use, the survey vessel must be thoroughly inspected and washed down. Any evident sources of contamination (such as copper or brass, or galvanised or oily surfaces) will be cleaned, covered in plastic and taped down to avoid accidental contamination of any sample. Lead diving weights will be stowed away and work surfaces will be covered with clean plastic sheeting.

6.4.4 Sampling equipment

Stainless steel, uPVC or Teflon equipment will be used, where practicable, to minimise the risk of cross contamination of samples. The following procedure will be used for cleaning the sampling equipment, or any other equipment used to handle samples, prior to obtaining each sample to be submitted for chemical analysis:

- An initial rinse with seawater
- A detergent solution scrub (Decon 90)
- A seawater rinse
- A final distilled water rinse

6.4.5 Sample collection

All staff collecting sediment samples will wear disposable nitrile, powder free gloves for each individual sample collected. This will ensure no cross-contamination between sample locations occurs.

6.4.6 Sample preservation

Once samples are collected and labelled, they will be promptly stored in the dark at less than 4°C (on ice bricks or in a refrigerator on the vessel) and transported to the testing laboratory within the specified holding times, ideally within 24 hours. Samples will be collected, preserved, stored and transported according to the requirements of the NAGD (2009) and instructions given by the analytical laboratory accompanied by a Chain of Custody form.

6.4.7 Sample labels

Each sample will be labelled with a sample number. The sample number will be unique to a particular sample and will be recorded with indelible ink on both the waterproof label and the cap of the sample bottle in case the sample label is lost or destroyed.

Table 6.5 identifies the sample types and the prefixes for the specific samples that will be used in the identification of the different samples from the potential DMPAs.

Table 6.5 Identification of samples

Sample type	Sample label prefix
Core/Grab samples	East Banks DMPA Expansion: EB01 – EB34 West Banks Island reclamation: WB01 – WB27 Port Central Expansion reclamation: PC01 – PC11 Western Basin Expansion: WBE01 – WBE21
Triplicates	T (eg T01)
Trip blanks	TB (eg TB01)
Rinsates	R (eg R01)

6.4.8 Analytical testing laboratories

All laboratories used for analysis will be NATA accredited and experienced in the chemical and physical analysis of marine sediments. 5% of samples will be checked with an independent NATA accredited laboratory.

6.4.9 Chain of custody

Chain of Custody forms will detail all samples collected and dispatched to the laboratory for analysis, including any specific comments or requirements (eg notes that samples are of marine origin and where samples are expected to be contaminated, or where ultra-trace tests are required). Details provided on the Chain of Custody forms will be as follows:

- Sampler
- Nature of sample
- Collection date
- Analysis requested
- Preservation method
- Time sampled
- Condition of samples at dispatch
- Staff contact details

6.4.10 Field QA/QC procedures

In addition to the internal laboratory quality assurance procedures, field replicates and quality assurance replicates will be collected and tested for the basic suite of contaminants of concern. Field QA/QC procedures to be implemented during sampling and analysis are outlined in Table 6.6.

Table 6.6 Field QA/QC procedures

QA/QC procedure	Frequency	Details
Trip blank	Once per day	One container filled with inert material (provided by the laboratory) to be transported with samples and analysed for volatile compounds

QA/QC procedure	Frequency	Details
Rinsate blank	Once per day	One rinsate container collected during the decontamination process where cross-contamination of samples is likely
Field triplicate	10% of samples	Two replicate samples collected at the same location as the primary sample and analysed to determine the variability of the sediment physical and chemical characteristics
Inter-laboratory duplicate	5% of samples	Replicate samples collected from the same homogenised sediment as the primary sample and analysed by the primary laboratory and secondary laboratory to identify variation associated with sub sample handling and variation in analytical protocol

6.4.11 Laboratory QA/QC procedures

In accordance with the NAGD (2009), the NATA accredited laboratories will include a range of QA/QC methods, which are summarised in Table 6.7.

Table 6.7 Laboratory QA/QC procedure details

QA/QC procedure	Analysis rate	Details
Laboratory blank	1 per 20 samples (or fewer)	Laboratory blanks are submitted with each sample batch during analysis to determine the level (if any) of cross contamination that may occur during laboratory preparation, extraction and/or analysis. Analysis of the laboratory blanks should result in contaminant concentrations that do not exceed the detection limit
Laboratory control	1 per 20 samples (or fewer)	Laboratory controls are submitted with each sample batch and contain known concentrations. Analysis of the laboratory controls should result in contaminant concentrations that do not deviate from the known concentration to determine the accuracy of the laboratory analysis
Laboratory spike (surrogate and matrix)	1 per 20 samples (or fewer)	A surrogate laboratory spike involves additions of a known concentration of compounds that are similar to those analysed, but are not likely to be present in the environment. The recovery of these compounds indicates the ability of the laboratory to extract the specified analyte. Surrogate spikes are generally performed on organic compounds A matrix laboratory spike is performed by splitting a sample and spiking it with a known contaminant concentration. The recovery of the contaminant is calculated and used to determine interference from the sediment upon the level of recovery
Laboratory duplicates	1 per 10 samples (or fewer)	Laboratory duplicates uses relative percent difference of an intra-laboratory split sample material to analyse laboratory precision

6.4.12 Validation and checking of laboratory results

Upon receipt of laboratory results, QA/QC results will be checked and the results reviewed for inconsistencies or atypical results. Validation of the laboratory data and field quality control samples will be undertaken according to the requirements of the NAGD (2009) and presented in the report.

7 Reporting

Once the approved SCP has been implemented, the DMPA Options Sediment Characterisation Implementation Report for the DMPA sites will be prepared and will contain the following sections:

- Introduction/purpose of the report
- Details of the sampling, including sample locations and depths, sample numbers (including QA samples), completed Chain of Custody forms, field logs, descriptions of the sediments and any issues encountered or deviations from the procedures outlined in the SCP
- Methodology including sample collection, processing, storage and analysis
- Results including compliance to NAGD (2009) Screening Levels, statistical analyses and data validation. All laboratory results and field data will be appended in full.
- QA/QC assessment of field and laboratory data and comparison to the DQOs
- Discussion, including an assessment of the suitability of the dredge material for various dredge material placement options as required under the NAGD (2009)
- Conclusions and recommendations

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **EA150H: Soil Particle Density as required for Hydrometer analysis according to AS 1289.3.6.3 2003 was unable to be performed for sample 18 as insufficient sample was supplied by the client. Typical SPD values used for calculations and consequently NATA endorsement does not apply to hydrometer results.**
- **EA151: ALS does not hold NATA accreditation for Settleability.**
- **EP090: High failing LCS deemed acceptable as all associated analyte results are less than LOR.**
- **EP090: Samples 'PC1 0.5-1.0A' and 'WB1 0.51.0A' show poor matrix spike recovery for Monobutyltin due to matrix interference.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Project	: GPC GEOCHEMICAL INVESTIGATION	QC Level	: NEPM 2013 Schedule B(3) and ALS QCS3 requirement
Site	: ----		
C-O-C number	: ----	Date Samples Received	: 05-FEB-2015
Sampler	: GK	Issue Date	: 26-FEB-2015
Order number	: 245553		
		No. of samples received	: 41
Quote number	: SY/1021/14 V2	No. of samples analysed	: 41

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP090: Organotin Compounds	4596905-002	----	**Monobutyltin**	78763-54-9	138 %	36-128%	**Recovery greater than upper control limit**
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1502604-001	PC1 0.5-1.0A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP090: Organotin Compounds	ES1502604-008	TRIPLICATE 1B	**Monobutyltin**	78763-54-9	16.2 %	35-130%	**Recovery less than lower data quality objective**
EP090: Organotin Compounds	ES1502604-001	PC1 0.5-1.0A	**Monobutyltin**	78763-54-9	30.0 %	35-130%	**Recovery less than lower data quality objective**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Duplicate outliers occur.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP090S: Organotin Surrogate	ES1502604-032	WB1 0.51.0A	**Tripropyltin**	----	131 %	35-130 %	**Recovery greater than upper data quality objective**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- **No Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- **No Quality Control Sample Frequency Outliers exist.**

Thanks Jacob for picking that up.

Yes this is a mistake on the CoC – Please schedule Duplicate 2A for Aurecon Suite 1.

Kind Regards

Saman Taeidi

Hi Saman,

Can you confirm if sample #9 should really be on hold or was it a mistake on the COC?

Jacob Waugh

C-O-C number	: ----	Date Samples Received	: 06-FEB-2015
Sampler	: GK	Issue Date	: 27-FEB-2015
Site	: ----		
		No. of samples received	: 60
Quote number	: SY/1021/14 V2	No. of samples analysed	: 60

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**
- **EK067G: Poor duplicate precision due to sample heterogeneity. Confirmed by re-extraction and re-analysis.**
- **EP090: High failing LCS deemed acceptable as all associated analyte results are less than LOR.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

C-O-C number	: ----	Date Samples Received	: 06-FEB-2015
Sampler	: GK	Issue Date	: 27-FEB-2015
Order number	: 245553		
		No. of samples received	: 60
Quote number	: SY/1021/14 V2	No. of samples analysed	: 60

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Wisam Marassa	Inorganics Coordinator	Sydney Inorganics

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Project	: GPC GEOCHEMICAL INVESTIGATION	QC Level	: NEPM 2013 Schedule B(3) and ALS QCS3 requirement
Site	: ----		
C-O-C number	: ----	Date Samples Received	: 06-FEB-2015
Sampler	: GK	Issue Date	: 27-FEB-2015
Order number	: 245553		
		No. of samples received	: 60
Quote number	: SY/1021/14 V2	No. of samples analysed	: 60

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EK067G: Total Phosphorus as P by Discrete Analyser	ES1503303-001	Anonymous	**Total Phosphorus as P**	----	20.0 %	0-20%	**RPD exceeds LOR based limits**
EP132B: Polynuclear Aromatic Hydrocarbons	ES1502902-001	Anonymous	**Sum of PAHs**	----	23.1 %	0-20%	**RPD exceeds LOR based limits**

CERTIFICATE OF ANALYSIS

Work Order	: **ES1502902**	Page	: 1 of 10
Client	: **AURECON AUSTRALASIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: SALLY LEYLAND	Contact	: Client Services
Address	: LOCKED BAG 331 32 TURBOT STREET BRISBANE QLD, AUSTRALIA 4001	Address	: 277-289 Woodpark Road Smithfield NSW Australia 2164
E-mail	: sally.leyland@aurecongroup.com	E-mail	: sydney@alsglobal.com
Telephone	: +61 07 3173 8006	Telephone	: +61-2-8784 8555
Facsimile	: +61 07 3173 8001	Facsimile	: +61-2-8784 8500
Project	: GPC GEOCHEMICAL INVESTIGATION	QC Level	: NEPM 2013 Schedule B(3) and ALS QCS3 requirement
Order number	: 245553		
C-O-C number	: ----	Date Samples Received	: 10-FEB-2015
Sampler	: GK	Issue Date	: 24-FEB-2015
Site	: ----		
		No. of samples received	: 7
Quote number	: SY/1021/14 V2	No. of samples analysed	: 7

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **EP090: Sample 'PC5 0.5-1.0A' shows poor matrix spike recovery for Monobutyltin due to matrix interference.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics
Dianne Blane	Laboratory Coordinator (2IC)	Newcastle - Inorganics
Kim McCabe	Senior Inorganic Chemist	Brisbane Acid Sulphate Soils
Pabi Subba	Senior Organic Chemist	Sydney Inorganics
		Sydney Organics
Ryan Story	2IC Organic Instrument Chemist	Brisbane Organics
Shobhna Chandra	Metals Coordinator	Sydney Inorganics

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Shobhna Chandra	Metals Coordinator	Sydney Inorganics

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Duplicate (DUP) RPDs							
EP132B: Polynuclear Aromatic Hydrocarbons	ES1502902-001	PC5 0.0-0.5A	**Sum of PAHs**	----	23.1 %	0-20%	**RPD exceeds LOR based limits**
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1502902-001	PC5 0.0-0.5A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP090: Organotin Compounds	ES1502902-002	PC5 0.5-1.0A	**Monobutyltin**	78763-54-9	23.5 %	35-130%	**Recovery less than lower data quality objective**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Laboratory Control outliers occur.**

Regular Sample Surrogates

Sub-Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Samples Submitted							
EP080-SD: TPH(V)/BTEX Surrogates	ES1502902-005	PC5 0.3V	**4-Bromofluorobenzene**	460-00-4	72.8 %	73-137 %	**Recovery less than lower data quality objective**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

- **No Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- **No Quality Control Sample Frequency Outliers exist.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**
- **EA150H: Soil Particle Density as required for Hydrometer analysis according to AS 1289.3.6.3 2003 was unable to be performed on samples #031, #032, #037, #047 and #052 as insufficient sample was supplied by the client. Typical SPD values used for calculations and consequently NATA endorsement does not apply to hydrometer results.**
- **EP090: Sample 'PC6 0.0-0.5A' shows poor matrix spike recovery for Monobutyltin due to matrix interference.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics

Satishkumar Trivedi	2 IC Acid Sulfate Soils Supervisor	Brisbane Acid Sulphate Soils
Shobhna Chandra	Metals Coordinator	Sydney Inorganics

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1503000-001	PC6 0.5-1.0A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP090: Organotin Compounds	ES1503000-002	PC6 0.0-0.5A	**Monobutyltin**	78763-54-9	10.0 %	35-130%	**Recovery less than lower data quality objective**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Duplicate outliers occur.**
- **For all matrices, no Laboratory Control outliers occur.**

Regular Sample Surrogates

- **For all regular sample matrices, no surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

Matrix: **WATER**

Method / Container / Client Sample ID(s)	Extraction / Preparation			Analysis		
	Date extracted	Due for extraction	Days overdue	Date analysed	Due for analysis	Days overdue
EK057G: Nitrite as N by Discrete Analyser						
Clear Plastic Bottle - Natural						
RINSATE 3	----	----	----	11-FEB-2015	10-FEB-2015	**1**

Outliers : Frequency of Quality Control Samples

The following report highlights breaches in the Frequency of Quality Control Samples.

- **No Quality Control Sample Frequency Outliers exist.**

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

				Method Blank (MB) Report	Laboratory Control Spike (LCS) Report			
					Spike	Spike Recovery (%)	Recovery Limits (%)	
Method: Compound	CAS Number	LOR	Unit	Result	Concentration	LCS	Low	High
EG005-SD: Total Metals in Sediments by ICP-AES (QCLot: 3829114)								
EG005-SD: Aluminium	7429-90-5	50	mg/kg	<50	6134 mg/kg	120	86	136
EG005-SD: Iron	7439-89-6	50	mg/kg	<50	8400 mg/kg	87.0	70	130
EG020-SD: Total Metals in Sediments by ICPMS (QCLot: 3829113)								
EG020-SD: Antimony	7440-36-0	0.5	mg/kg	<0.50	----	----	----	----

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

Matrix Spike (MS) and Matrix Spike Duplicate (MSD) Report

The quality control term Matrix Spike (MS) and Matrix Spike Duplicate (MSD) refers to intralaboratory split samples spiked with a representative set of target analytes. The purpose of these QC parameters are to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Interpretive Quality Control Report contains the following information:

- Analysis Holding Time Compliance
- Quality Control Parameter Frequency Compliance
- Brief Method Summaries
- Summary of Outliers

Analysis Holding Time Compliance

This report summarizes extraction / preparation and analysis times and compares each with recommended holding times (USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055-103	SOIL	In-house. A gravimetric procedure based on weight loss over a 12 hour drying period at 103-105 degrees C. This method is compliant with NEPM (2013) Schedule B(3) Section 7.1 and Table 1 (14 day holding time).
Particle Size Analysis by Hydrometer	EA150H	SOIL	Particle Size Analysis by Hydrometer according to AS1289.3.6.3 - 2003
Soil Particle Density	* EA152	SOIL	Soil Particle Density by AS 1289.3.5.1-2006 : Methods of testing soils for engineering purposes - Soil classification tests - Determination of the soil particle density of a soil - Standard method A modification of the AS 1289.3.5.1 method may apply when testing dispersed soils also tested by AS1289.3.6.3. This modification uses the dispersion solution from AS1289.3.6.3 in place of water for density determinations
Total Fe and Al in Sediments by ICPAES	EG005-SD	SOIL	In house: Referenced to APHA 21st ed., 3120; USEPA SW 846 - 6010. Metals are determined following an appropriate acid digestion of the soil. The ICPAES technique ionises samples in a plasma, emitting a characteristic spectrum based on metals present. Intensities at selected wavelengths are compared against those of matrix matched standards. This method is compliant with NEPM (2013) Schedule B(3). LORs per NODG
Total Metals in Sediments by ICPMS	EG020-SD	SOIL	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector. Analyte list and LORs per NODG.
Total Mercury by FIMS (Low Level)	EG035T-LL	SOIL	In house: Referenced to AS 3550, APHA 21st ed., 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. Mercury in solids are determined following an appropriate acid digestion. Ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N - Soluble by Discrete Analyser	EK057G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- B. Nitrite in a water extract is determined by direct colourimetry by Discrete Analyser.
Nitrate as N - Soluble by Discrete Analyser	EK058G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3--F. Nitrate in the 1:5 soil:water extract is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results.
Nitrite and Nitrate as N (NOx)- Soluble by Discrete Analyser	EK059G	SOIL	In house: Referenced to APHA 21st ed., 4500 NO3- F. Combined oxidised Nitrogen (NO2+NO3) in a water extract is determined by Chemical Reduction, and direct colourimetry by Discrete Analyser.
TKN as N By Discrete Analyser	EK061G	SOIL	In house: Referenced to APHA 21st ed., 4500-Norg-D Soil samples are digested using Kjeldahl digestion followed by determination by Discrete Analyser.
Total Nitrogen as N (TKN + NOx) By Discrete Analyser	EK062G	SOIL	In house: Referenced to APHA 21st ed., 4500 Norg/NO3- Total Nitrogen is determined as the sum of TKN and Oxidised Nitrrogen, each determined seperately as N.
Total Phosporus By Discrete Analyser	EK067G	SOIL	In house: Referenced to APHA 21st ed., 4500 P-B&F This procedure involves sulfuric acid digestion and quantification using Discrete Analyser.
Ammonia in Sediments	EK255A SD	SOIL	Rayment and Higginson (1992) Method 7C1 and 7C2. This method measures exchangeable ammonium which is defined by the amount of ammonium released by shaking sediment with an un-buffered 2M potassium chloride solution.

Analytical Methods	Method	Matrix	Method Descriptions
Total Organic Carbon	EP003	SOIL	In-house C-IR17. Dried and pulverised sample is reacted with acid to remove inorganic Carbonates, then combusted in a LECO furnace in the presence of strong oxidants / catalysts. The evolved (Organic) Carbon (as CO2) is automaticaly measured by infra-red detector.
TPH - Semivolatile Fraction	EP071-SD	SOIL	(USEPA SW 846 - 8270B) Extracts are analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3) (Method 504)
TRH Volatiles/BTEX in Sediments	EP080-SD	SOIL	(USEPA SW 846 - 8260B) Extracts are analysed by Purge and Trap, Capillary GC/MS. Quantification is by comparison against an established 5 point calibration curve.
Organotin Analysis	EP090	SOIL	(USEPA SW 846 - 8270D) Prepared sample extracts are analysed by GC/MS coupled with high volume injection, and quanitified against an established calibration curve.
Organophosphorus Pesticides (Ultra-trace)	EP130	SOIL	USEPA Method 3640 (GPC cleanup), 8141 (GC/FPD - Capillary Column) This technique is compliant with NEPM (2013) Schedule B(3) (Method 505)
Organochlorine Pesticides (Ultra-trace)	EP131A	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PCB's (Ultra-trace)	EP131B	SOIL	USEPA Method 3640 (GPC cleanup),3620 (Florisil), 8081/8082 (GC/uECD/uECD) This technique is compliant with NEPM (2013) Schedule B(3) (Method 504)
PAHs in Sediments by GCMS(SIM)	EP132B-SD	SOIL	USEPA 8270 GCMS Capillary column, SIM mode using large volume programmed temperature vaporisation injection.
Total Metals by ICP-MS - Suite A	EG020A-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Metals by ICP-MS - Suite B	EG020B-T	WATER	In house: Referenced to APHA 21st ed., 3125; USEPA SW846 - 6020, ALS QWI-EN/EG020. The ICPMS technique utilizes a highly efficient argon plasma to ionize selected elements. Ions are then passed into a high vacuum mass spectrometer, which separates the analytes based on their distinct mass to charge ratios prior to their measurement by a discrete dynode ion detector.
Total Mercury by FIMS	EG035T	WATER	In house: Referenced to AS 3550, APHA 21st ed. 3112 Hg - B (Flow-injection (SnCl2)(Cold Vapour generation) AAS) FIM-AAS is an automated flameless atomic absorption technique. A bromate/bromide reagent is used to oxidise any organic mercury compounds in the unfiltered sample. The ionic mercury is reduced online to atomic mercury vapour by SnCl2 which is then purged into a heated quartz cell. Quantification is by comparing absorbance against a calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Ammonia as N by Discrete analyser	EK055G	WATER	In house: Referenced to APHA 21st ed., 4500-NH3 G Ammonia is determined by direct colorimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrite as N by Discrete Analyser	EK057G	WATER	In house: Referenced to APHA 21st ed., 4500-NO2- B. Nitrite is determined by direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Nitrate as N by Discrete Analyser	EK058G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Nitrate is reduced to nitrite by way of a chemical reduction followed by quantification by Discrete Analyser. Nitrite is determined seperately by direct colourimetry and result for Nitrate calculated as the difference between the two results. This method is compliant with NEPM (2013) Schedule B(3)

Analytical Methods	Method	Matrix	Method Descriptions
Nitrite and Nitrate as N (NOx) by Discrete Analyser	EK059G	WATER	In house: Referenced to APHA 21st ed., 4500-NO3- F. Combined oxidised Nitrogen (NO2+NO3) is determined by Chemical Reduction and direct colourimetry by Discrete Analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Kjeldahl Nitrogen as N By Discrete Analyser	EK061G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg D (In house). An aliquot of sample is digested using a high temperature Kjeldahl digestion to convert nitrogenous compounds to ammonia. Ammonia is determined colorimetrically by discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Total Nitrogen as N (TKN + Nox) By Discrete Analyser	EK062G	WATER	In house: Referenced to APHA 21st ed., 4500-Norg / 4500-NO3-. This method is compliant with NEPM (2013) Schedule B(3)
Total Phosphorus as P By Discrete Analyser	EK067G	WATER	In house: Referenced to APHA 21st ed., 4500-P H, Jirka et al (1976), Zhang et al (2006). This procedure involves sulphuric acid digestion of a sample aliquot to break phosphorus down to orthophosphate. The orthophosphate reacts with ammonium molybdate and antimony potassium tartrate to form a complex which is then reduced and its concentration measured at 880nm using discrete analyser. This method is compliant with NEPM (2013) Schedule B(3)
Polychlorinated Biphenyls (PCB)	EP066	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
Pesticides by GCMS	EP068	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH - Semivolatile Fraction	EP071	WATER	USEPA SW 846 - 8015A The sample extract is analysed by Capillary GC/FID and quantification is by comparison against an established 5 point calibration curve of n-Alkane standards. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
PAH/Phenols (GC/MS - SIM)	EP075(SIM)	WATER	USEPA SW 846 - 8270D Sample extracts are analysed by Capillary GC/MS in SIM Mode and quantification is by comparison against an established 5 point calibration curve. This method is compliant with NEPM (2013) Schedule B(3)
TRH Volatiles/BTEX	EP080	WATER	USEPA SW 846 - 8260B Water samples are directly purged prior to analysis by Capillary GC/MS and quantification is by comparison against an established 5 point calibration curve. Alternatively, a sample is equilibrated in a headspace vial and a portion of the headspace determined by GCMS analysis. This method is compliant with the QC requirements of NEPM (2013) Schedule B(3)
Organotin Compounds (Soluble)	EP090H	WATER	(USEPA SW 846 - 8270D, ALS QWI-ORG/EP090) Sample extracts (ALS QWI-ORG/035) are analysed by GC/MS coupled with high volume injection (10-50µL). Quantitation is achieved using internal standard and average response factor quantitation techniques against an established five-point curve. Butyltin results are reported in either "as tin" units eg. ng Sn/L or "ng TBT+/L". The analytical standards are prepared in "as tin" units. Sample results are converted to TBT+ results as required.

Preparation Methods	Method	Matrix	Method Descriptions
TKN/TP Digestion	EK061/EK067	SOIL	APHA 21st ed., 4500 Norg- D; APHA 21st ed., 4500 P - H. Macro Kjeldahl digestion.
1:5 solid / water leach for soluble analytes	EN34	SOIL	10 g of soil is mixed with 50 mL of distilled water and tumbled end over end for 1 hour. Water soluble salts are leached from the soil by the continuous suspension. Samples are settled and the water filtered off for analysis.
Methanolic Extraction of Soils for Purge and Trap	* ORG16	SOIL	(USEPA SW 846 - 5030A) 5g of solid is shaken with surrogate and 10mL methanol prior to analysis by Purge and Trap - GC/MS.
Tumbler Extraction of Solids/ Sample Cleanup	ORG17A-UTP	SOIL	In-house, Mechanical agitation (tumbler). 20g of sample, Na2SO4 and surrogate are extracted with 150mL 1:1 DCM/Acetone by end over end tumble. Samples are extracted, concentrated (by KD) and exchanged into an appropriate solvent for GPC and florisil cleanup as required.

Preparation Methods	Method	Matrix	Method Descriptions
Tumbler Extraction of Solids for LVI (Non-concentrating)	ORG17D	SOIL	In house: 10g of sample, Na2SO4 and surrogate are extracted with 50mL 1:1 DCM/Acetone by end over end tumbling. An aliquot is concentrated by nitrogen blowdown to a reduced volume for analysis if required.
Organotin Sample Preparation	ORG35	SOIL	In house. 20g sample is spiked with surrogate and leached in a methanol:acetic acid:UHP water mix and vacuum filtered. Reagents and solvents are added to the sample and the mixture tumbled. The butyltin compounds are simultaneously derivatised and extracted. The extract is further extracted with petroleum ether. The resultant extracts are combined and concentrated for analysis.
TKN/TP Digestion	EK061/EK067	WATER	APHA 21st ed., 4500 Norg - D; APHA 21st ed., 4500 P - H. This method is compliant with NEPM (2013) Schedule B(3)
Digestion for Total Recoverable Metals	EN25	WATER	USEPA SW846-3005 Method 3005 is a Nitric/Hydrochloric acid digestion procedure used to prepare surface and ground water samples for analysis by ICPAES or ICPMS. This method is compliant with NEPM (2013) Schedule B(3)
Separatory Funnel Extraction of Liquids	ORG14	WATER	USEPA SW 846 - 3510B 100 mL to 1L of sample is transferred to a separatory funnel and serially extracted three times using 60mL DCM for each extract. The resultant extracts are combined, dehydrated and concentrated for analysis. This method is compliant with NEPM (2013) Schedule B(3) . ALS default excludes sediment which may be resident in the container.
Organotin Sample Preparation	ORG34H	WATER	(IN HOUSE, ALS QWI-ORG/35) A specified volume (determined by the detection limit requirement) of sample is spiked with surrogate, acidified and vacuum filtered. Reagents and solvent are added to the sample and the mixture tumbled for 20 minutes. The butyltin compounds is derivitisated, extracted and the subtitution reaction is completed. The extracts is transferred to a separatory funnel and further extracted two times using petroleum ether. The resultant extracts are combined and concentrated to the desired volume for analysis.

Summary of Outliers

Outliers : Quality Control Samples

The following report highlights outliers flagged in the Quality Control (QC) Report. Surrogate recovery limits are static and based on USEPA SW 846 or ALS-QWI/EN/38 (in the absence of specific USEPA limits). This report displays QC Outliers (breaches) only.

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EK255A SD: Ammonia in Sediment	ES1503080-014	WB10 0.0-0.5A	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EK255A SD: Ammonia in Sediment	ES1502850-041	Anonymous	**Ammonia as N**	7664-41-7	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

- **For all matrices, no Method Blank value outliers occur.**
- **For all matrices, no Duplicate outliers occur.**
- **For all matrices, no Laboratory Control outliers occur.**

Regular Sample Surrogates

- **For all regular sample matrices, no surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

This report displays Holding Time breaches only. Only the respective Extraction / Preparation and/or Analysis component is/are displayed.

Matrix: **SOIL**

Method / Container / Client Sample ID(s)	Extraction / Preparation: Date extracted	Extraction / Preparation: Due for extraction	Extraction / Preparation: Days overdue	Analysis: Date analysed	Analysis: Due for analysis	Analysis: Days overdue

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting

- **Benzo(a)pyrene Toxicity Equivalent Quotient (TEQ) is the sum total of the concentration of the eight carcinogenic PAHs multiplied by their Toxicity Equivalence Factor (TEF) relative to Benzo(a)pyrene. TEF values are provided in brackets as follows: Benz(a)anthracene (0.1), Chrysene (0.01), Benzo(b+j) & Benzo(k)fluoranthene (0.1), Benzo(a)pyrene (1.0), Indeno(1.2.3.cd)pyrene (0.1), Dibenz(a.h)anthracene (1.0), Benzo(g.h.i)perylene (0.01). Less than LOR results for 'TEQ Zero' are treated as zero.**

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Project	: GPC Geochemical Investigation	QC Level	: NEPM 2013 Schedule B(3) and ALS QCS3 requirement
Site	: ----		
C-O-C number	: ----	Date Samples Received	: 12-FEB-2015
Sampler	: GK	Issue Date	: 28-FEB-2015
Order number	: 245553		
		No. of samples received	: 20
Quote number	: SY/1021/14 V2	No. of samples analysed	: 20

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted. All pages of this report have been checked and approved for release.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

NATA Accredited Laboratory 825

Accredited for compliance with ISO/IEC 17025.

Signatories

This document has been electronically signed by the authorized signatories indicated below. Electronic signing has been carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
Ankit Joshi	Inorganic Chemist	Sydney Inorganics
Ashesh Patel	Inorganic Chemist	Sydney Inorganics
Dianne Blane	Laboratory Coordinator (2IC)	Newcastle - Inorganics
Pabi Subba	Senior Organic Chemist	Sydney Inorganics
		Sydney Organics
Ryan Story	2IC Organic Instrument Chemist	Brisbane Organics
Satishkumar Trivedi	2 IC Acid Sulfate Soils Supervisor	Brisbane Acid Sulphate Soils
Shobhna Chandra	Metals Coordinator	Sydney Inorganics
Wisam Marassa	Inorganics Coordinator	Sydney Inorganics

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Spike (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Spike (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**
